## Z80 Assembly programming for the Amstrad CPC

The CPC was the 8 bit I grew up with... while slower in some ways than the C64, it had far superior graphical capabilities to the ZX Spectrum, and usually beats the MSX for graphical speed because of it's smaller screen footprint (16k on the CPC to 24k on the MSX) and its CRTC graphics chip is favoured by the modern clever demo authors...

While the budget tape-based 464 machine had 64k, the disk system - the 6128 - has 128k and a disk system... and after market upgrades can give the machine up to 576k

There were two major generations of the CPC, the regular version, and the version released in the 90... the CPC+, which has hardware sprites, enhanced color

## AY Sound Chip:

Register	Meaning	Bit Meaning	Details
0	Tone Pitch L - Channel A	LLLLLLLL	Lower value = Higher pitch
1	Tone Pitch H - Channel A	----HHHH	Lower value = Higher pitch
2	Tone Pitch L - Channel B	LLLLLLLL	Lower value = Higher pitch
3	Tone Pitch H - Channel B	----HHHH	Lower value = Higher pitch
4	Tone Pitch L - Channel C	LLLLLLLL	Lower value = Higher pitch
5	Tone Pitch H - Channel C	----HHHH	Lower value = Higher pitch
6	Noise Generator	---NNNNN	Higer = Faster noise
7	Mixer	--NNNTTT	N=Noise T=Tone (Channel --CBACBA 1=mute 0=normal)
8	Amplitude - Channel A	---E VVVV	E=Envelope (1=Enabled) VVVV=Volume
9	Amplitude - Channel B	---E VVVV	E=Envelope (1=Enabled) VVVV=Volume
10	Amplitude - Channel C	---E VVVV	E=Envelope (1=Enabled) VVVV=Volume
11	Envelope L (Volume over time)	LLLLLLLL	Lower=Faster Envelope
12	Envelope H (Volume over time)	HHHHHHHH	Lower=Faster Envelope
13	Envelope Selection	----EEEE	Envelope number (See PDF)

For more details, please see the [AY sound chip PDF](#)

## Gate Array:

The Gate array is at port &7Fxx... It has multiple purposes depending on the top two bits passed in the C byte

7	6	5	4	3	2	1	0	Name	Bit meanings
0	0	-	B	P	P	P	P	Pen Selection	B=Border P=Pen (0-3 / 0-15)
0	1	-	C	C	C	C	C	Palette color selection	C= Color number (0-26)
1	0	-	I	H	L	M	M	Rom / Mode	I= Interrupt mode H=High rom bank L=Low rom bank M=screen mode

CRTC

The CRTC registers are selected with &BCxx (where xx is the register number)... and set with &BDxx (where xx is the new value

Hight Byte Value	F	E	D	C	B	A	9	8	Name
&BC	1	0	1	1	1	1	0	0	Register Select
&BD	1	0	1	1	1	1	0	1	Register Write

CRTC - Registers

CRTC registers will configure the Logical screen we draw on, and the physical screen shown by the Analog monitor...

You'll want to leave many of the settings alone, as they'll just result in a corrupt screen you can't view!

Reg Num	Name	Range	Bits	Default Value	Specy 256x192	Overscaln 384x272(26k)	Details
&00	Horizontal Total	0-255	DDDDDDDD	63	63	63	Physical width of screen ⚡ Leave alone!

## CPC Plus hardware sprites!

The Amstrad CPC has 16 hardware sprites... each is 16x16

CPC+ sprites have a separate 16 colors to the normal palette, also they are always 16 color, even in mode 1!  
CPC+ Sprite colors (-GRB) are defined by the range &6422-&643F

Sprite Number	DataAddr (256bytes)	Xpos (2bytes)	Ypos (2bytes)	Resolution (1byte)
1	&4000	&6000	&6002	&6004
2	&4100	&6008	&600A	&600C
3	&4200	&6010	&6012	&6014
4	&4300	&6018	&601A	&601C
5	&4400	&6020	&6022	&6024
6	&4500	&6028	&602A	&602C
7	&4600	&6030	&6032	&6034
8	&4700	&6038	&603A	&603C
9	&4800	&6040	&6042	&6044

[Buy my Assembly programming book on Amazon in Print or Kindle!](#)

Available worldwide!  
 Search 'ChibiAkumas' on  
 your local Amazon website!  
[Click here for more info!](#)

10	&4900	&6048	&604A	&604C
11	&4A00	&6050	&6052	&6054
12	&4B00	&6058	&605A	&605C
13	&4C00	&6060	&6062	&6064
14	&4D00	&6068	&606A	&606C
15	&4E00	&6070	&6072	&6074
16	&4F00	&6078	&607A	&607C

DataAddr is the pointer to the sprite data... note only 4 bits of each byte are used (----CCCC).... so 16x16=256 bytes

Xpos is 2 bytes, in little endian format... screen co-ordinates are based on mode 2 - so xpos should be between -64 to +639 (0 is leftmost visible pixel)

Ypos is 2 bytes, in little endian format... Ypos should be between -64 to +200 (0 is topmost visible pixel)

Resolution is defined by a single byte:  
 PP

Each (X,Y) size can be 0-3... 0 will mean the sprite isn't shown, 1,2,3 are magnifications 1,2 and 4.... however please note, these are relative to Mode 2... so 'square' pixels are defined by %00001001 = 9

This is why You'll see in ChibiAkumas, sprites are set to 'on' with a value of 9, or 'off' with a value of 0

## Keyboard Matrix

	0	1	2	3	4	5	6	7
&40	C-U	C-R	C-D	F9	F6	F3	F-ENT	F.
