13.0 COMMENTS ON THE SOURCE LISTING

This document contains the source listing of the ColorForth system. It is intended for those who are interested in understanding how the system works. It is not intended for those who are interested in writing their own programs.

14.0 FORTH-79

This section contains a brief description of the FORTH-79 language. It is intended for those who are interested in learning more about the FORTH-79 language.

15.0 SUPPORT FILES

This section contains a brief description of the support files. It is intended for those who are interested in learning more about the support files.

This section contains a brief description of the support files. It is intended for those who are interested in learning more about the support files.

This section contains a brief description of the support files. It is intended for those who are interested in learning more about the support files.

1.0 INTRODUCTION AND STARTUP

This document describes the COLORFORTH system provided in a rom pack for the RADIO SHACK COLOR COMPUTER. It is an extension of the FORTH Interest Group (fig) model of the language FORTH.

1.1 REQUIREMENTS

SOFTWARE

Rom COLOR BASIC must be resident in the computer in order for COLORFORTH to function. EXTENDED BASIC is not required.

HARDWARE

The COLOR COMPUTER must have at least 4k bytes of memory. COLORFORTH will automatically adjust to more if you have it. To use the cassette interface, it is necessary that the computer have control over the motor.

1.2 DISCLAIMER

This software is sold as is. It is believed to be free of error, but as we all know, no large piece of software is ever completely free of problems, so BEWARE!

1.3 HOWEVER

If you find any errors in the software, please notify the distributor so that future versions may be corrected.

1.4 STARTUP

To start COLORFORTH:

1. Verify power is off.
*** NEVER, NEVER INSERT OR REMOVE CARTRIDGES ***
*** WITH THE POWER ON !!! ***
2. Plug the cartridge into the slot on the side.
3. ONLY THEN turn on the power.

The computer should start up with a message on the screen saying that COLORFORTH is in control and "BELL" tone should be heard if you have the sound turned up.

1.5 FIRST IMPRESSIONS

After COLORFORTH is started as described previously, the FORTH operating system is running, with its compiler, interpreter, and text editor. Several changes from BASIC may be noted. First, if the volume is turned up on your television, you will notice a 'tick' sound emitted as each key is pressed. This is to help reduce key errors by providing a positive feedback indication that a key has been sensed. Second, if you use the backwards arrow key to backspace the cursor and erase characters, you will notice that a "BELL" tone is emitted with each key stroke when the cursor is at the beginning of the line. If you do not wish to hear these tones, simply turn the volume of the television down.

1.6 WHAT IS COLORFORTH ?

COLORFORTH is an implementation of fig-FORTH with the addition of many FORTH-79 words plus many words which provide interfaces to features specific to the COLOR computer. In FORTH the term "word" refers to an identifiable function or command, which in some computer languages is referred to as a subroutine or procedure.

If you wish to run FORTH-79 software, you should carefully read the sections which describe how COLORFORTH differs from FORTH-79.

COLORFORTH contains many features which are supplements to fig-FORTH and FORTH-79. You have full control over the allocation of memory between dictionary space (for programs) and the virtual input/output buffers (where, e.g., text for source code is edited). This permits you to optimize the use of memory for your specific application.

Binary overlays (compiled programs) are supported. This permits you to save compiled programs on tape for later use. For a large application this can save the time to load the program from tape by about a factor of three to four.

Sound output is possible in two forms: single tones (as in BASIC) and a high speed procedure which permits arbitrary waveforms to be sent.

A full assembler is not included; however, the vocabulary and a few basic words are included which permit an advanced programmer to insert specially hand coded machine language routines. A full 6809 FORTH assembler will be available on cassette.

A FORTH DECOMPILER is included as a learning and debugging tool.

1.7 NEW USER OF FORTH OR A VETERAN ?

Are you a FORTH veteran? If so, skip the next paragraph.

Are you a newcomer to the FORTH environment? If so, you should purchase the book STARTING FORTH by L. Brodie. This is a good introduction to this new and fascinating programming tool known as FORTH. It is published by Prentice-Hall and should be available from bookstores or your COLORFORTH distributor. COLORFORTH provides a complete programming environment which in many respects is far superior to BASIC. As you learn how to do FORTH programming, you will initially find some of the methods of doing things to be peculiar. The environment, however, has evolved over many years by expert programmers who honed the environment for efficiency and speed. Once you learn the fundamental methods of FORTH programming, you too will find that you can put your machine to work in sophisticated ways with far less programming effort than by using other computer languages. You may wish to skim through Chapter 2 to get an idea of how the COLORFORTH system is organized, but do not fret over the fact that some of it may sound obscure -- nothing in there is necessary for one to use the basic system. Come back to it later after you have gotten a feel for the way the system works.

If you are a FORTH veteran, then you may be interested in the system configuration which is described in Chapter 2.

1.8 WHAT IS THE FORTH INTEREST GROUP (FIG) ?

The FORTH INTEREST GROUP is an independent group of FORTH enthusiasts whose aims are to educate others and to promote FORTH. They may be contacted at

P O Box 1105
San Carlos, CA 94070 (415) 962-8653

They publish a newsletter FORTH DIMENSIONS (\$12/yr) and have many other publications available.

2.0 COLORFORTH SYSTEM CONFIGURATION

The following describes some of the aspects of how the COLORFORTH system is organized and how it is similar and/or dissimilar to other FORTH systems.

NOTICE!! If you are a complete beginner to FORTH, you should probably skip this section for now, and go to the book STARTING FORTH which you should have purchased. Just start working through the book. Do not be afraid of experimenting! The program is in the ROM PACK and can not be destroyed by any programming error. Just press the RESET button at the right rear and restart if necessary.

ALSO!! Your ROM PACK contains fig-FORTH which is not identical to the version of the FORTH-79 which is discussed by the author of the book STARTING FORTH, so refer to the later section entitled FORTH-79 DIFFERENCES as you go through the book.

NOTATION --

The following symbol terminology is used throughout this manual.

SYMBOLS	MEANING
a1 or addr1	16 bit address
n, n1, n2	16 bit signed number
d1, d2	32 bit signed double number
u1, u2	16 bit unsigned number
b1	8 bit byte -- unsigned
c	7 bit ascii character
f	Boolean flag
tf	True boolean flag -- 1
ff	False boolean flag - 0
string1, t	Ascii text string

STACK VALUES (b -- t ; a)

b the stack before the word executes
-- the word being defined
t the string which follows the word in some cases
; denotes the place where the <ENTER> key would be pressed
a the stack after the word executes

STACK PARAMETER DESCRIPTIONS

n1\n2\n3

stack contains n1, then n2, then n3

The value n1 was placed on the stack first, then n2, then n3.

The notation is read "n1 under n2 under n3". n1 is on top.

E.g.

In the description of a FORTH word called <name>, the following might appear:
a1\n1\n2 -- t ; a2

which is interpreted as follows: before the word <name> is executed there are three items on the stack with n2 being the last placed on, n1 the previous one, and a1 the earliest one. Following <name> in the keyboard input is the text string t followed by pressing the <ENTER> key.

Following the execution of the word <name>, the stack is left with the one item a2.

2.1 MEMORY ALLOCATION

COLORFORTH will run on any RADIO SHACK COLOR COMPUTER with 4k, 16k, or 32k bytes of user read/write memory (RAM). The system is normally initialized with 8 screen buffers (only 1 on a 4k machine); each buffer is 1028 bytes in length, and holds one FORTH SCREEN (or BLOCK) of 1024 (1k) bytes of data plus 4 bytes of control information. The terms SCREEN and BLOCK are used somewhat interchangably; however, SCREEN is more appropriate in the case of text (displayed to the television screen) and BLOCK is a more abstract term useful in cases where the data is either text, numerical data, or machine code. The term buffer refers to one or more of the sets of machine memory locations dedicated to holding the SCREENs and BLOCKs. The existance of 8 buffers means that a program consisting of 8k of text may be edited or manipulated in memory, without resort to moving text to and from tape.

The maximum number of BLOCKS in memory (preset to 8 -- or 1 in the case of a 4k machine) is held in a variable named BMAX. The FORTH word BLOCK will not permit you to request a block number greater than BMAX or less than 1. The value of BMAX may be changed by use of the word called #BLOCKS. This will cause the system to change the number of buffers it uses and the space reclaimed is used for compiled program dictionary space. E.g., to change the allocation to 3 buffers, use

```
3 #BLOCKS <ENTER>
```

(The notation <ENTER> is used to denote the place in the input where the key on the terminal marked "ENTER" is pressed. Similarly, <BREAK> would indicate where the key marked "BREAK" is pressed.)

The above sequence will recover 5k bytes for additional dictionary space (until a RESET causes it to go back to default value). A similar operation could be done to increase the number of buffers used (and therefore, of course, reduce the amount of program storage available).

Some caution should be taken with the use of the #BLOCKS command. It changes not only the number of buffers, but it also moves the user ram pointer called CDP. Any program you have compiled up to the time you use #BLOCKS will be destroyed.

The system stacks are located below the lowest screen buffer. The RETURN STACK shares a page (of 256 bytes) of memory with the TERMINAL INPUT BUFFER, so its size is limited to about one hundred levels of nesting. The DATA STACK is allocated about 2

2.4 CASSETTE INTERFACE

Five words have been included in the system to permit easy writing and reading of data to and from cassette. These are:

READ	(n1 --)
READS	(n1\n2 --)
WRITE	(n1 --)
WRITES	(n1\n2 --)

In these words, n1 is the first SCREEN or BLOCK to read or write. n2, when present, is the number of SCREENs or BLOCKs to read or write.

DO NOT FORGET TO SET THE RECORDER TO THE PLAY OR RECORD MODE, AS APPROPRIATE, BEFORE PRESSING THE <ENTER> KEY.

The fifth word is

CLOADS (n1 --)

n1 screens will be loaded from cassette, and compiled or interpreted. Each SCREEN will be read into buffer 1 and then 1 LOAD is performed. Then the next screen is read and loaded, etc. This procedure was chosen so that only a single buffer would be required in order to have the system function with minimal memory. This means that a very large program may be compiled. The number n1 specifies the number of screens to be read and loaded, and it must match the actual number of screens on the cassette.

NOTE: For CLOADS to function properly, it must control the cassette motor. So, the motor control wires must be connected.

NOTE: In FORTH, spaces are extremely significant. In the use of the words above, e.g., 19 CLOADS , it is essential that there be a space between 19 and CLOADS .

2.5 DOWN-LOADED WORDS

Several words are downloaded from ROM into RAM so that parts of them may be changed. They occupy about 80 bytes and include:

(ABORT)	BLOCK	
FORTH	ASSEMBLER	EDITOR

(ABORT) is moved to ram so that its run-time behavior may be changed by the user. BLOCK is moved to ram for the same reason. FORTH , EDITOR , and ASSEMBLER are VOCABULARIES and must be in RAM in order to function.

2.6 WHAT IS MISSING ?

IMPLEMENTATION OF THE COLORFORTH SYSTEM

There are several fig-FORTH words which are not in this system. For the most part these are words in the fig-FORTH vocabulary which are used for disk interfaces. They are not needed in this implementation. They are

BUFFER	+BUF	R/W	INDEX	TRIAD	PREV	USE
FLUSH	UPDATE		EMPTY-BUFFERS			

If desired, an experienced programmer can add or change the hook for BLOCK as described above. This will add a disk buffering routine to the system.

2.7 NEXT AND THE VALUE SET UT READING AND THE DT THROU FWD

For the interested assembly language programmer, NEXT is at \$C052.

Implementation of the next word depends upon the assembly language being used. In the current version of the system, the next word is implemented as follows:

The first instruction of the next word is a branch to the DT block. The DT block contains the following code:

Read and return the value of the stack cell. If the stack cell is empty, then the next word is completed and the next word is returned.

If the stack cell is not empty, then the next word is completed and the next word is returned.

If the stack cell is not empty, then the next word is completed and the next word is returned.

The next word is completed and the next word is returned.

2.8 MEMORY MAP

I	FORTH NUCLEUS	\$C000 \$E7FF

3.0 EDITOR

3.1 EDITOR COMMENTS

The EDITOR contained in the rom pack is modeled after the editor described in the introductory book STARTING FORTH by L. Brodie. The EDITOR here has been extended and improved. The most obvious change is that the screen being edited is always immediately displayed to the user. The word `L` is therefore not needed (although it is present). Owing to limitations with the size of the television display, only a "window" into the screen is displayed at any moment. The window is an area of 11 lines, centered around the cursor position.

The edit buffer is treated as 32 lines of 32 characters. The 11 lines surrounding the cursor position are displayed at the top of the screen area, and the 12th line is displayed in reverse video with the current screen number, line number, and cursor position. Lines 13 to 16 of the display show the user command input.

If you have just turned on the computer, any screen to be edited must first be cleared to blanks by:

`n1 CLEAR <ENTER>`

The number `n1` is the screen number to clear. Note: For the examples in the book STARTING FORTH and the discussion in this manual, use screens numbered 1 to 8 as that is all you have in this cassette oriented system. You can now start the edit session by:

`n1 EDITOR`

The television will display the split screen format described above. At this point the upper section should be blank, with a black square in the upper left corner of the screen, and your normal blinking cursor in the lower left corner. The black cursor is the pointer into the edit area, and it is the cursor referred to in the instructions to the editor which follow.

For a complete discussion of the use of the basic edit commands you should refer to the book STARTING FORTH, although it is similar enough to typical fig-FORTH editors that an experienced FORTH programmer should be able to use the editor with just the abbreviated discussion presented below. The extensions to the editor are discussed below also.

3.2 LINE SPREADS

The two commands "SP" and "U" cause the text below the cursor to be moved down by one line. Since only a part of the edit buffer can be viewed at a time, there is a possibility that you will try to spread text off the bottom of the edit buffer. To prevent this, a protection word "?31" has been installed for use inside "SP" and "U". This word causes a warning to be sent to the display if data will be lost from line 31, and then the system waits for your response. You may abort your command if you do not want to lose line 31.

3.3 EDITOR INTERNALS

This editor has its own interpreter, called QIT. This word allows the editor to split the screen into two parts and trap errors while remaining in the editor vocabulary. This is possible because the editor traps all errors by changing the function of (ABORT) to vector to ERR instead of ABORT. WARNING is changed to -1 to force all errors to go through (ABORT) to ERR. The word QUIT is redefined to restore WARNING and (ABORT) to their former state and then go to the FORTH#QUIT. So, when in the EDITOR, to get back into FORTH you should type

QUIT <ENTER>

3.4 AN EDITOR EXAMPLE:

```
1 CLEAR
 1 EDIT
 3 T
 P THIS IS A LINE OF TEXT
 WIPE
 P THIS IS A LINE OF TEXT.
 U HERE IS ANOTHER ONE

 3 T P EXAMPLE OF TWO COMMANDS
 X
 QUIT
```

3.5 EDITOR WORDS

WORD **(b -- t ; a)** **FUNCTION**

LINE EDITING COMMANDS:

From STARTING FORTH editor:

cursor is at start of current line. Text after cursor is in PADI.

T **(n --)** Sets the cursor to start of line n.
cursor now points to start of line n.

P **(-- t;)** Text following space after P is placed into
line pointed to by cursor.

U **(-- t;)** Text following space after U is inserted
under the current line and all lower lines
are moved down one.

M **(n1\n2 --)** Copies current line pointed to by cursor
UNDER line n2 on block n1.

X **(--)** Deletes line pointed to by cursor and moves
lower lines up one. Line 31 becomes blank.

Added from fig editors: no graphical line editors
writer accepts drawing as extow, not fig because

H **(-- s)** Holds the line pointed at by cursor in PADI.

K **(n--)** Kills (erases) the line pointed at by cursor.

no kill, trapping file before trying to do so

SP **(b--)** SPreads the lines --- the line pointed at by
cursor and the cursor and all following lines move down one.
It tests line 31 for potential data loss.

Up Arrow, **Down Arrow** Current line becomes blank.

Up arrow: cursor moves up one line if possible

TOP **(--)** Moves cursor to TOP of edit screen.

Up arrow: cursor moves up one line if possible

BOT **(--)** Moves cursor to BOTtom of edit screen.

Up arrow: cursor moves up one line if possible

(--) Down arrow: Moves cursor to beginning of next
entitled line. If no title, moves to beginning of next

(-- ,#) Up Barrow: Moves cursor to beginning of
current and previous line. If no title, moves to beginning
of next entitled line. If no title, moves to beginning of next

(--) Double down arrow: Moves cursor to beginning
of next entitled line or fourth (4th) line below current line.

(--) Double up arrow: Moves cursor to beginning
of next entitled line or fourth (4th) line before current line.

*Enter
after
arrow
key*

Double Left Arrow: Enters and exits command mode. If in command mode, left arrow moves cursor left one character. If not in command mode, left arrow moves cursor left one line.

Double Right Arrow: Enters and exits command mode. If in command mode, right arrow moves cursor right one character. If not in command mode, right arrow moves cursor right one line.

STRING EDITING COMMANDS:

From STARTING FORTH editor:

for next line
to word

F (-- t;) Finds first occurrence of the text following the blank after F. Starts at current cursor position.

S (n -- t;) Searches for the text string following the command S. Starts on current screen and goes to screen n-1. Stops at each occurrence of the string and you then may either:
 press <BREAK> to stop search and leave cursor pointing at string, or
 press any other key to continue search.

E (--) Erases as many characters GOING BACKWARDS from cursor as are in the buffer PADF.
 Typically used after F or S.

D (-- t;) Deletes first occurrence of text following the command D, searching from cursor position to end of screen.

TILL (-- t;) Deletes all text starting at cursor position until and including the string following the command TILL . Works on current screen only.
 If string not found, no delete occurs.

I (-- t;) Inserts text following the command I into the edit buffer after the current position of the cursor. Text following is pushed off end of line and those at end are lost.

R (-- t;) Replaces the string just found (by, e.g., F) with the string following the command R .

Additions to editor:

+T (n --) Sets cursor to current line plus n.

C/L (-- n) Returns number of characters per line (32).

DEL (n --) Deletes n characters BEFORE the cursor and compresses the line to omit the space.
 Fills end of line with blanks.

C (n --) Cursor movement: moves forward (or backwards if n is negative) by n characters.

(R) (--) Text at PADI replaces the text in the current line.

(F) (--) Searches for the string in PADF, starting with the current cursor position till end of the screen.

(I) (--) Inserts the current contents of PADI into

which occurs. The edit buffer at the location of the cursor. When done, any text pushed off end of line is lost.

EDIPADB (anywhere) Edit pad buffer.

BMOV (a1 --) String at PAD is moved to address a1.

(writing anywhere) Write buffer.

PADE (a1 -- a1) Returns address of the Find buffer as a1.

(writing anywhere) Insert buffer.

PADI (-- a1) Returns address of the Insert buffer as a1.

(writing anywhere) Delete buffer.

PAD (-- a1) Returns address of scratchPAD area as a1.

TEXT ((c -- t;)) Accepts text following command TEXT into address c into scratchpad area PAD up to the character with ascii value, c, (or up to maximum of C/L characters or <ENTER>).

GTEXT (a1 --) Accepts text from input screen until a end of line delimiting ^ is found or the <ENTER> key is pressed; text is moved to address a1.

FULL SCREEN ORIENTED COMMANDS:

From STARTING FORTH editor: (writing anywhere) Screen editor.

WIPE (--) Clears the current screen to all blanks.

COPY (n1\>n2 --) Copies screen n1 to screen n2.

Added to the editor: (writing anywhere) To editor is not screen oriented editor.

N (--) Go to Next higher edit screen and reset cursor to top of screen.

B (--) Go Back to previous screen and reset cursor to top of screen.

L (--) Lists the current screen. Not needed with print screen oriented editor.

EDIT (n1 --) Sets EDITOR vocabulary, modifies (ABORT) to point to ERR, sets WARNING to -1, and then executes QIT.

CLEAR (n1 --) CLEARS screen n1 to all blanks.

is not screen oriented and must be fully qualified. (writing anywhere) To clear screen n1 of memory.

It is possible to define and execute a new editor by specifying the full name of the screen editor.

The EDIT command will be followed by the definition of the new editor, starting with the first command word.

NEW (n1 --) Permits entry of NEW lines of text into current edit screen, staying in input mode till a null line is entered. EXAMPLE:

```
1 EDIT <ENTER>      ( selects editor )
3 T<ENTER>          ( set cursor to line 3 )
NEW <ENTER>          ( start NEW insert mode )
THIS IS A TEST<ENTRY>
THIS IS ANOTHER TEST<ENTRY>
<ENTER>              ( type this (a null line) )
```

After THIS, the two lines of text following NEW will be placed in lines 3 and 4 of screen \1. Previous contents of those lines are lost. The line with <ENTRY> only is a null line (i.e. it contains nothing) terminates the input mode; line \5 will be unchanged and the input mode will be exited back to the normal edit mode.

MISCELLANEOUS EDITOR WORDS

These are normally not ever directly used by a user, but an enterprising programmer who wishes to extend the EDITOR might use them.

-TEXT (a1\ n1\ a2 -- f) Primitive string match routine.

Matches string at a1 against string at a2, for a count of n1 characters. Flag f is returned true (1) if strings match; otherwise, f is returned false (0). Written in assembly.

MATCH (a1\ n1\ a2\ n2 -- tf\ n3) for a match
-- ff\ n1) for no match

String match routine which starts a search at a1 for a count of n1 characters. The string at a2 of length n2 is searched for as a substring of a1,n1 . If the string a2,n2 is found, a true flag (tf = 1) is returned along with n3 = the number of bytes from a1 to the end of the string match. If string a2,n2 is not found, a false flag (ff = 0) is returned, and n1 is on the stack.

ILINE (. -- f) Uses MATCH to scan the current line for a match to the string in PADF . Returns flag f = true if found, false if not. Updates cursor position to end of matching string if found, or to end of line if no match.

-MOVE (a1\ n1 --) MOVES C/L characters from address a1 to line n1 of the current edit screen.

LINE (n1 -- a1) Returns the address a1 of the line n1 of the current edit screen.

#LOCATE (-- n1\n2) Returns the cursor location in the current edit screen. n2 is the line number, and n1 is the character position.

>L# (-- n1) Returns current line number as n1.

#LEAD (-- a1\n1) Returns the address of the cursor line as a1 and the position in the line as n1.

#LAG (-- a1\n2) Returns address of the cursor in the current screen as a1, and the number of characters from the current position to the line end as n2.

SERR (--) Issues message "NONE" for no string found.

QUIT (--) EDITOR's INTERPRETER word. Scrolls the lower 4 lines only, views the current window into the edit buffer, and accepts and interprets commands from the operator. Is an infinite loop, terminated only by execution of QUIT .

ERR (n1 --) ERRor handler for the EDITOR; prints the error indication "<?" and the error message and then goes to QUIT .

QUIT (--) This is EDITOR's redefinition of the FORTH word QUIT . It is used to exit the EDITOR. It restores WARNING to 1, restores (ABORT) to point to ABORT, restores the condition of the display screen to its normal state, restores the vocabulary to FORTH, and then executes the FORTH QUIT .

SCROL (--) SCROLls the lower 4 lines of the display, and sets the cursor in the lower left corner of the screen.

RANGE (n1 -- n2) System word used to limit screen number n1 to the range 1 to BMAX; limited number is n2.

V (--) Calculates the window around the cursor and displays it on the screen. Window is the 11 lines surrounding the cursor. Then the cursor position in the current line is shown.

?31 (--) Test line 31 of current screen for being empty. If so, does nothing. If not empty, prompt operator with notice that data will be lost; go to QIT if user responds with "Y" so that no loss will occur.

!CUR (n1 --) Store n1 into variable #R (the cursor position) after limiting it to a range within the current edit screen (i.e., n1 is limited to 0 <= n1 <= 1023 .

4.0 fig-FORTH VOCABULARY

The following is a copy of the glossary of the words from the standard fig-FORTH Installation Manual. The notation used is similar to the notation defined earlier for use throughout the rest of this manual. There are words in this glossary which are not contained in COLORFORTH; they are indicated with an asterisk after their names. These are discussed previously in the section WHAT IS MISSING? They relate to disk input and output functions. COLORFORTH contains other words which are described in the EDITOR section or in the next sections.

With the exception of the words listed below, most of the words

which appear in this section are described elsewhere.

WORD and WORDLIST: A WORD is a string of characters in fig-FORTH which is associated with a particular function. A WORDLIST is a collection of WORDS which have been combined together to form a command or object. A WORDLIST may contain WORDS which are not defined in fig-FORTH. These WORDS are called external WORDS. External WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORD: A WORDLIST-WORD is a WORD which is part of a WORDLIST. WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORD is a WORDLIST-WORD which is part of another WORDLIST. WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORDLIST-WORD is a WORDLIST-WORDLIST-WORD which is part of another WORDLIST-WORDLIST. WORDLIST-WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD is a WORDLIST-WORDLIST-WORDLIST-WORD which is part of another WORDLIST-WORDLIST-WORDLIST. WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD is a WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD which is part of another WORDLIST-WORDLIST-WORDLIST. WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD is a WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD which is part of another WORDLIST-WORDLIST-WORDLIST-WORDLIST. WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD: A WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD is a WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORD which is part of another WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST. WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDLIST-WORDS are usually defined by the manufacturer of the system or by a third party.

fig-FORTH GLOSSARY

10

base field quadrature, a multi-dimensional general field quadrature method, consisting of different quadrature rules for each dimension, resulting in a product rule.

This glossary contains all of the word definitions in Release 1 of fig-FORTH. The definitions are presented in the order of their ascii sort. *Word* refers to the first line of each entry, *param* to the parameter stack, and *stack* to the stack.

The first line of each entry shows a symbolic description of the action of the procedure on the parameter stack. The symbols indicate the order in which input parameters have been placed on the stack. Three dashes ("---") indicate the execution point; any parameters left on the stack are listed. In this notation, the top of the stack is to the right.

16CL 16 bit signed integer. A step function (base) of the stack. It is zeroed by **16CL**. The symbols include:
 a 16 bit signed integer
 d 16 bit signed double-integer
 m 16 bit memory address
 n 16 bit number
 b 16 bit bytes (i.e. hi 8 bits zero)
 c 16 bit ascii character (hi 9 bits zero)
 d 16 bit 32 bit signed double-integer,
 rotated most significant portion with sign
 on top of stack.
f boolean flag. 0=false, non-zero=true
ff boolean false flag=0
nn 16 bit signed integer number
uu 16 bit unsigned integer
tf 16 bit boolean true flag=non-zero
 -stacked cases until flag and definition
 -stacked cases until flag and definition

18

18CL 18 bit signed integer. A step function (base) of the stack. It is zeroed by **18CL**. The symbols include:
 a 18 bit signed integer
 d 18 bit signed double-integer
 m 18 bit memory address
 n 18 bit number
 b 18 bit bytes (i.e. hi 9 bits zero)
 c 18 bit ascii character (hi 10 bits zero)

24CL 24 bit signed integer. A step function (base) of the stack. It is zeroed by **24CL**. The symbols include:
 a 24 bit signed integer
 d 24 bit signed double-integer
 m 24 bit memory address
 n 24 bit number
 b 24 bit bytes (i.e. hi 12 bits zero)
 c 24 bit ascii character (hi 13 bits zero)

32CL 32 bit signed integer. A step function (base) of the stack. It is zeroed by **32CL**. The symbols include:
 a 32 bit signed integer
 d 32 bit signed double-integer
 m 32 bit memory address
 n 32 bit number
 b 32 bit bytes (i.e. hi 16 bits zero)
 c 32 bit ascii character (hi 17 bits zero)

40CL 40 bit signed integer. A step function (base) of the stack. It is zeroed by **40CL**. The symbols include:
 a 40 bit signed integer
 d 40 bit signed double-integer
 m 40 bit memory address
 n 40 bit number
 b 40 bit bytes (i.e. hi 20 bits zero)
 c 40 bit ascii character (hi 21 bits zero)

48CL 48 bit signed integer. A step function (base) of the stack. It is zeroed by **48CL**. The symbols include:
 a 48 bit signed integer
 d 48 bit signed double-integer
 m 48 bit memory address
 n 48 bit number
 b 48 bit bytes (i.e. hi 24 bits zero)
 c 48 bit ascii character (hi 25 bits zero)

The capital letters on the right show definition characteristics: base or over
 memory address or stack. The others:

C May only be used within a colon definition. A digit indicates number of memory addresses used, if other than the less-than-one. **E** Intended for execution only. **L0** Level Zero definition of FORTH-78. **L1** Level One definition of FORTH-78. **P** Has precedence bit set. Will execute even when compiling. **U** A user variable.

a Unless otherwise noted, all references to numbers are for 16 bit signed integers. On 8 bit data bus computers, the high byte of a number is on top of the stack, with the sign in the leftmost bit. For 32 bit signed double numbers, the most significant part (with the sign) is on top.

All All arithmetic is implicitly 16 bit signed integer math, with error and underflow indication unspecified. Such carry and overflow must be handled here.

base The base of the stack. The stack grows away from the base.

branch (verb) Translating and executing memory to code busy. Translates the provided memory to executable code. The provided code is not modified. The code is not yet run. Instead, it is placed in memory to be executed at a later time. This is done to reduce memory usage when translating memory to code.

carry (verb) Translating and executing memory to code busy. Translates the provided memory to executable code. The provided code is not modified. The code is not yet run. Instead, it is placed in memory to be executed at a later time. This is done to reduce memory usage when translating memory to code.

execute (verb) Translating and executing memory to code busy. Translates the provided memory to executable code. The provided code is not modified. The code is not yet run. Instead, it is placed in memory to be executed at a later time. This is done to reduce memory usage when translating memory to code.

get (verb) Translating and executing memory to code busy. Translates the provided memory to executable code. The provided code is not modified. The code is not yet run. Instead, it is placed in memory to be executed at a later time. This is done to reduce memory usage when translating memory to code.

load (verb) Translating and executing memory to code busy. Translates the provided memory to executable code. The provided code is not modified. The code is not yet run. Instead, it is placed in memory to be executed at a later time. This is done to reduce memory usage when translating memory to code.

	n addr ---	LO	(+LOOP) n ---	The run-time procedure compiled by +LOOP, which increments the loop index by n and tests for loop completion. See +LOOP.	C2
	Store 16 bits of n at address. Pronounced "store".				
	ICSP				
	Save the stack position in CSP. Used as part of the compiler security.				
	addr1 d1 --- d2	LO	(ABORT)	Executes after an error when WARNING is -1. This word normally executes ABORT, but may be altered (with care) by the user into a user's alternative procedure.	
	Generate from a double number d1, the next ascii character which is placed in an output string. Result d2 is the quotient after division by BASE, and is maintained for further processing. Used between <# and #>. See #S.	LO	(DO)	The run-time procedure compiled by DO which moves the loop control parameters to the return stack. See DO.	
	#S	LO	(FIND)	addr1 addr2 --- pfa b tf (ok) addr1 addr2 --- ff (bad) Searches the dictionary starting at the name field address addr2, matching to the text at addr1. Returns (ok) parameter field address, id length of name field and boolean true for a good match. If no match is found, only a boolean false is left.	
	#> nc numbered --- a address count ok	LO	(LINE)	nl n2 --- a address count	
	terminates numeric output conversion to pfa by dropping ad, leaving the text of a right side of address and character count suitable for TYPE. Note that if decimal edit ad is used then conversion is done and generation of digits using convertable characters is suppressed. See nc ad in aplia	LO	Convert the line number nl and the screen n2 to the disc buffer address containing the data. A count of 64 indicates the full line text length.		
	#S	LO	(LOOP)	The run-time procedure compiled by LOOP which increments the loop index and tests for loop completion. See LOOP.	C2
	--- addr	P,LO	(NUMBER)	dl addr1 --- d2 addr2 Convert the ascii text beginning at addr1+1 with regard to BASE. The new value is accumulated into double number dl, being left as d2. Addr2 is the address of the first unconvertable digit. Used by NUMBER.	
	Used in the form: ' nnnn		*	nl n2 --- prod	LO
	Leaves the parameter field address of dictionary word nnnn. As a compiler directive, executes in a colon-definition to compile the address as a literal. If the word is not found after a search of CONTEXT and CURRENT, an appropriate error message is given. Pronounced "tick".		*	Leave the signed product of two signed numbers.	
		P,LO			
	Used in the form: (cccc)				
	Ignore a comment that will be delimited by a right parenthesis on the same line. May occur during execution or in a colon-definition. A blank after the leading parenthesis is required.				
(.)		C+	*/	nl n2 n3 --- n4	LO
	The run-time procedure, compiled by ." which transmits the following in-line text to the selected output device. See ."			Leave the ratio $n4 = n1 * n2 / n3$ where all are signed numbers. Retention of an intermediate 31 bit product permits greater accuracy than would be available with the sequence: nl n2 * n3 /	
(;CODE)		C			
	The run-time procedure, compiled by ;CODE, that rewrites the code field of the most recently defined word to point to the following machine code sequence. See ;CODE.				
			*/MOD	nl n2 n3 --- n4 n5	LO
				Leave the quotient n5 and remainder n4 of the operation $n1 * n2 / n3$. A 31 bit intermediate product is used as for */.	

+1 n1 n2 --- sum
Leave the sum of n1+n2.
+I n addr --- LO
Add n to the value at the address.
Pronounced "plus-store".

+BUF * n1 n2 --- addr1 f
+BUF * n1 n2 --- addr2 f
+BUF * n1 n2 --- n3
Advance the disc buffer address addr1
to the address of the next buffer
addr2. Boolean f is false when addr2
is the buffer presently pointed to
by variable PREV.

+LOOP n1 --- (run)
+LOOP n1 n2 --- (compile) P,C2,LO
Used in a colon-definition in the
form:

DO ... n1 +LOOP

At run-time, +LOOP selectively
controls branching back to the cor-
responding DO based on n1, the loop
index, the increment index and the loop limit. The signed
increment index increment n1 is added to the index
and index and the total compared to the limit.
The branch back to DO occurs until
either the new index is equal to or greater
than the limit ($n1 > 0$), or until the
new index is equal to or less than
the limit ($n1 < 0$). Upon exiting the
loop, the parameters are discarded
and execution continues ahead.

+ORIGIN n --- addr
Leave the memory address relative
by n to the origin parameter area.
n is the minimum address unit, either
byte or word. This definition is used
to access or modify the boot-up
parameters at the origin area.

+QUOT n1 n2 --- quot
Store n into the next available dict-
ionary memory cell, advancing the
dictionary pointer. (comma)

- n1 n2 --- diff LO
Leave the difference of n1-n2.
--> P,L0
Continue interpretation with the
next disc screen. (pronounced
next-screen).

LO -DUP n1 -- n1 --- (if zero)
n1 -- n1 n1 (non-zero) LO
Reproduce n1 only if it is non-zero.
This is usually used to copy a value
just before IF, to eliminate the need
for an ELSE part to drop it.

-FIND --- pfa b tf (found)
--- ff (not found)
Accepts the next text word (delimited
by blanks) in the input stream to
HERE, and searches the CONTEXT and
then CURRENT vocabularies for a
matching entry. If found, the
dictionary entry's parameter field
address, its length byte, and a
boolean true is left. Otherwise,
only a boolean false is left.

-TRAILING addr n1 --- addr n2
Adjusts the character count n1 of a
text string beginning address to
suppress the output of trailing
blanks. i.e. the characters at
addr+n1 to addr+n2 are blanks.

n --- LO
Print a number from a signed 16 bit
two's complement value, converted
according to the numeric BASE.
A trailing blanks follows.
Pronounced "dot".

." --- P,LO
Used in the form:
.cccc" ."
Compiles an in-line string cccc
(delimited by the trailing ".") with an
execution procedure to transmit the
text to the selected output device.
If executed outside a definition, ."
will immediately print the text until
the final ". The maximum number of
characters may be an installation
dependent value. See (.").

.LINE line scr ---
Print on the terminal device, a line
of text from the disc by its line and
screen number. Trailing blanks are
suppressed.

.R n1 n2 ---
Print the number n1 right aligned in
a field whose width is n2. No
following blank is printed.

/ n1 n2 --- quot LO
Leave the signed quotient of n1/n2.
n1 and n2 are both signed integers
and the result is also signed.

/MOD n1 n2 --- rem quot LO
Leave the remainder and signed
quotient of n1/n2. The remainder has
the sign of the dividend. If
the dividend is negative and
the divisor is positive, the result
will always have the same sign as the
dividend. If the dividend is negative
and the divisor is negative, the result
will always have the same sign as the
dividend.

0 1 2 3	---	n	These small numbers are used so often that it is attractive to define them by name in the dictionary as constants.
0<	n	--- f	Leave a true flag if the number is less than zero (negative), otherwise leave a false flag.
0=	n	--- f	Leave a true flag if the number is equal to zero, otherwise leave a false flag.
OBRANCH	f	---	The run-time procedure to conditionally branch. If f is false (zero), the following in-line parameter is added to the interpretive pointer to branch ahead or back. Compiled by IF, UNTIL, and WHILE.
1+	nl	--- n2	Leave nl incremented by 1.
2+	nl	--- n2	Leave nl incremented by 2.
:			Used in the form called a colon-definition:
;	cccc	... ;	Creates a dictionary entry defining cccc as equivalent to the following sequence of Forth word definitions '...' until the next ';' or ';CODE'. The compiling process is done by the text interpreter as long as STATE is non-zero. Other details are that the CONTEXT vocabulary is set to the CURRENT vocabulary and that words with the precedence bit set (P) are executed rather than being compiled.
;			Terminate a colon-definition and stop further compilation. Compiles the run-time ;S.
;CODE	cccc	... ;CODE	Used in the form: ;cccc ... ;CODE Assembly mnemonics Stop compilation and terminate a new defining word cccc by compiling (;CODE). Set the CONTEXT vocabulary to ASSEMBLER, assembling to machine code the following mnemonics.
;	cccc	... ;cccc	When cccc later executes in the form and ;cccc nnnn ;cccc the word nnnn will be created with its execution procedure given by the machine code following cccc. That is, when nnnn is executed, it does so by jumping to the code after nnnn. An existing defining word must exist in cccc prior to ;CODE.

;S Stop interpretation of a screen.
 ;S is also the run-time word compiled
 at the end of a colon-definition
 which returns execution to the
 calling procedure.

< nl n2 --- f LO
 Leave a true flag if nl is less than
 n2; otherwise leave a false flag.

<#
 Setup for pictured numeric output
 formatting using the words:
 <#PRES #S "SIGN "#>
 The conversion is done on a double
 word value in the parameter area
 producing text at PAD.

<BUILD> C,LO
 Used within a colon-definition:
 : cccc <BUILD> ...
 <BUILD> DOES> ... ;
 Each time cccc is executed, <BUILD>
 defines a new word with a high-level
 execution procedure. Executing cccc
 in the form:
 cccc nnnn
 uses <BUILD> to create a dictionary
 entry for nnnn with a call to the
 <BUILD> part for nnnn. When nnnn is
 later executed, it has the address of
 its parameter area on the stack and
 executes the words after <BUILD> in
 sequence. <BUILD> and <CODE> allow run-
 time procedures to be written in high-
 level rather than in assembler code
 (as required by ;CODE).

- nl n2 --- f LO
 Leave a true flag if nl=n2; other-
 wise leave a false flag.

> nl n2 --- g-f LO
 Leave a true flag if nl is greater
 than n2; otherwise a false flag.

>R n --- C,LO
 Remove a number from the computation
 stack and place as the most access-
 able on the return stack. Use should
 be balanced with R> in the same
 definition.

? addr -- LO
 Print the value contained at the
 address in free format according to
 the current base. It is zero'd
 (unless) specified (otherwise)

!COMP
 Issue error message if not compiling.

!CSP
 If the stack position is not valid.

Issue error message if stack position differs from value saved in CSP.

TERROR f n ---
Issue an error message number n, if the boolean flag is true.

?EXEC n ---
Issue an error message if not executing.

?LOADING n ---
Issue an error message if not loading.

?PAIRS n1 n2 n3 ---
Issue an error message if n1 does not equal n2. The message indicates that compiled conditionals do not match.

?STACK n ---
Issue an error message if the stack is out of bounds. This definition may be installation dependent.

?TERMINAL f n ---
Perform a test of the terminal keyboard for actuation of the break key. A true flag indicates actuation. This definition is installation dependent.

ABORT n ---
Leave the 16 bit contents of address. May be used explicitly or implicitly by the FORTH kernel or user code.

ABORT n ---
Clear the stacks and enter the execution state. Return control to the operators terminal, printing a message appropriate to the installation.

ABS lsf n d ---
Leave the absolute value of n as u. May be used explicitly or implicitly by the FORTH kernel or user code.

AGAIN addr n --- (compiling) P,C2,LO
Used in a colon-definition in the form:
BEGIN ... AGAIN ...
At run-time, AGAIN forces execution to return to corresponding BEGIN. There is no effect on the stack. Execution cannot leave this loop (unless R> DROP is executed one level below).

ALLOT n ---
Add the signed number to the dictionary pointer DP. May be used to reserve dictionary space or re-origin memory. n must be with regard to computer address type (byte or word).

AND n1 n2 n3 ---
Leave the bitwise logical and of n1 and n2 as n3.

B/BUF --- n
This constant leaves the number of bytes per disc buffer, the byte count read from disc by BLOCK.

B/SCR --- n
This constant leaves the number of blocks per editing screen. By convention, an editing screen is 1024 bytes organized as 16 lines of 64 characters each.

BACK addr ---
Calculate the backward branch offset from HERE to addr and compile into the next available dictionary memory address.

BASE lsf n --- U,LO
A user variable containing the current number base used for input and output conversion.

BEGIN --- addr n (compiling) P,LO
Occurs in a colon-definition in form:
BEGIN ... UNTIL
BEGIN ... AGAIN
BEGIN ... WHILE ... REPEAT
At run-time, BEGIN marks the start of a sequence that may be repetitively executed. It serves as a return point from the corresponding UNTIL, AGAIN or REPEAT. When executing UNTIL, a return to BEGIN will occur if the top of the stack is false; for AGAIN and REPEAT a return to BEGIN always occurs.

BL --- c
A constant that leaves the ascii value for "blank".

BLANKS addr count ---
Fill an area of memory beginning at addr with blanks.

BLK lsf n ---addr U,LO
A user variable containing the block number being interpreted. If zero, input is being taken from the terminal input buffer.

BLOCK n --- addr LO
Leave the memory address of the block buffer containing block n. If the block is not already in memory, it is transferred from disc to which ever buffer was least recently written. If the block occupying that buffer has been marked as updated, it is rewritten to disc before block n is read into the buffer. See also BUFFER, R/W UPDATE FLUSH

BLOCK-READ

BLOCK-WRITE These are the preferred names for the installation dependent code to read and write one block to the disc.

BRANCH C2,LO

The run-time procedure to unconditionally branch. An in-line offset is added to the interpretive pointer IP to branch ahead or back. BRANCH is compiled by ELSE, AGAIN, REPEAT.

BUFFER X

Obtain the next memory buffer, assigning it to block n. If the contents of the buffer is marked as updated, it is written to the disc. The block is not read from the disc. The address left is the first cell within the buffer for data storage.

C1 b addr ---

Store 8 bits at address. On word addressing computers, further specification is necessary regarding byte addressing.

TARGET --- either --- either

Store data from memory addressed by

C, either --- b ---

Store 8 bits of b into the next available dictionary byte, advancing the dictionary pointer. This is only available on byte addressing computers, and should be used with caution on byte addressing mini-computers.

C2 either --- either --- either

Leave the 8 bit contents of memory address. On word addressing computers, further specification is needed regarding byte addressing.

CFA pfa --- cfa

Convert the parameter field address of a definition to its code field address. The address is left as 16-bit double words after conversion.

CMOVE from to count ---

Move the specified quantity of bytes beginning at address from to address to. The contents of address from to is moved first proceeding toward high memory. Further specification is necessary on word addressing computers.

CD either --- either --- either

Code cold start procedure to cold start. The cold start procedure to adjust the dictionary pointer to the minimum standard and restart via ABORT. May be called from the terminal to remove application programs and do a restart. Used with OS bootstrap code and function code with base memory address and length.

COMPILE

When the word containing COMPILE executes, the execution address of the word following COMPILE is copied (compiled) into the dictionary. This allows specific compilation situations to be handled in addition to simply compiling an execution address (which the interpreter already does).

CONSTANT n ---

A defining word used in the form: n CONSTANT cccc to create word cccc, with its parameter field containing n. When cccc is later executed, it will push n onto the stack.

CONTEXT --- addr

A user variable containing a pointer to the vocabulary within which dictionary searches will first begin.

COUNT addr --- addr2 n

Leave the byte address addr2 and byte count n of a message text beginning at address addr1. It is presumed that the first byte at addr1 contains the text byte count and the actual text starts with the second byte. Typically COUNT is followed by TYPE.

CR either --- either --- either

Transmit a carriage return and line feed to the selected output device.

CREATE --- either --- either

A defining word used in the form: CREATE cccccccccc to create such words as CODE and CONSTANT to create a dictionary header for a Forth definition. The code field contains the address of the words parameter field. The new word is created in the CURRENT vocabulary.

CSP ---addr ---

A user variable temporarily storing the stack pointer position, for compilation error checking.

D+ d1 d2 --- dsunif

Leave the double number sum of two double numbers. No alignment is required since words have been stored in double word-sized fields.

D+- d1 n --- d2

Apply the sign of n to the double number d1, leaving it as d2.

D. ---addr ---

Print a signed double number from a 32 bit's complement value. The high-order 16 bits are most accessible on the stack. Conversion is performed according to the current BASE. A blank follows. Pronounced D-dot.

The D-dot has selected edit mode, and is in use.

D.R	d n ---	Print a signed double number d right aligned in a field n characters wide.	DO	n1 n2 --- (execute) addr n --- (compile) P,C2',LO
DABS	d --- ud	Leave the absolute value ud of a double number.	DO	Occurs in a colon-definition in form: <colon> DO ... LOOP
DECIMAL	base LO	Set the numeric conversion BASE for decimal input-output.	DO	DO ... +LOOP At run time, DO begins a sequence with repetitive execution controlled by a loop limit n1 and an index with initial value n2. DO removes these from the stack. Upon reaching LOOP the index is incremented by one. Until the new index equals or exceeds the limit, execution loops back to just after DO; otherwise the loop parameters are discarded and execution continues ahead. Both n1 and n2 are determined at run-time and may be the result of other operations.
DEFINITIONS	cccc DEFINITIONS LL	Used in the form: cccc DEFINITIONS Set the CURRENT vocabulary to the CONTEXT vocabulary. In the example, executing vocabulary name cccc made it the CONTEXT vocabulary and executing DEFINITIONS made both specify vocabulary cccc.	DO	Within a loop 'I' will copy the current value of the index to the stack. See I, +LOOP, LEAVE.
DIGIT	c nl --- n2 tf (ok) c nl --- ff (bad)	Converts the ascii character c (using base nl) to its binary equivalent n2, accompanied by a true flag. If the conversion is invalid, leaves only a false flag.	DOES>	When compiling within the colon-definition, DO compiles (DO), leaves the following address addr and n for later error checking.
DLIST		List the names of the dictionary entries in the CONTEXT vocabulary.	DOES>	A word which defines the run-time action within a high-level defining word. DOES> alters the code field and first parameter of the new word to execute the sequence of compiled word addresses following DOES>. Used in combination with <BUILD>. When the DOES> part executes it begins with the address of the first parameter of the new word on the stack. This allows interpretation using this area or its contents. Typical uses include the Forth assembler, multi-dimensional arrays, and compiler generation.
DLITERAL	d --- d P (executing) d --- (compiling)	If compiling, compile a stack double number into a literal. Later execution of the definition containing the literal will push it to the stack. If executing, the number will remain on the stack.	DP	dp --- addr U,L A user variable, the dictionary pointer, which contains the address of the next free memory above the dictionary. The value may be read by HERE and altered by ALLOT.
DMINUS	d1 --- d2	Convert d1 to its double number two's complement.	DPL	dp, offset --- addr U,LO A user variable containing the number of digits to the right of the decimal point on double integer input. It may also be used hold output column location of a decimal point, in user generated floating point formatting. The default value on entry memory single number input is -1.
DRO		Installation dependent commands to select disc drives, by presetting OFFSET. The contents of OFFSET is added to the block number in BLOCK to allow for this selection. Offset is suppressed for error text so that it may always originate from drive 0.	DRI	
DR1			OFFSET	
DR2			BLOCK	

DROP	Drop the number from the stack.	LO	ENDIF <i>addr n ---</i> (compile) P,C0,LO Occurs in a colon-definition in form: IF ... ENDIF IF ... ELSE ... ENDIF
DUMP <i>addr n ---</i>	Print the contents of n memory locations beginning at addr. Both addresses and contents are shown in the current numeric base.	LO	At run-time, ENDIF serves only as the destination of a forward branch from IF or ELSE. It marks the conclusion of the conditional structure. THEN is another name for ENDIF. Both names are supported in fig-FORTH. See also IF and ELSE.
DUP <i>val n ---</i>	Duplicate the value on the stack.	LO	
ELSE <i>addr1 n1 --- addr2 n2</i>	At compile-time, IF ... (compiling) P,C2,LO Occurs within a colon-definition in the form: IF ... ELSE ... ENDIF At run-time, ELSE executes after the true part following IF. ELSE forces execution to skip over the following false part and resumes execution after the ENDIF. It has no stack effect.	LO	At compile-time ELSE emplaces BRANCH reserving a branch_offset, leaves the address addr2 and n2 for error testing. ELSE also resolves the pending forward branch from IF by calculating the offset from addr1 to HERE and storing at addr1.
EMIT <i>c ---</i>	Transmit ascii character c to the selected output device. OUT is incremented for each character output.	LO	At compile-time EMIT reserves code space for the selected output device and increments OUT.
EMPTY-BUFFERS	Mark all block-buffers as empty, not necessarily affecting the contents. Updated blocks are not written to the disc. This is also an initialization procedure before first use of the disc.	LO	fig-FORTH saves the contents of IN and BLK to assist in determining the location of the error. Final action is execution of QUIT.
ENCLOSE <i>addr1 n1 --- addr2 n2 ddrl n3</i>	The text scanning primitive used by WORD. From the text address addr1 through addr2 and an ascii delimiting character c, is determined the byte offset to the first non-delimiter character n1, the offset to the first delimiter after the text n2, and the offset to the first character not included. This procedure will not process past an ascii 'null', treating it as an unconditional delimiter.	P,C2,LO	EXECUTE <i>addr ---</i> Execute the definition whose code field address is on the stack. The code field address is also called the compilation address.
EXPECT	addr count ---	LO	Transfer characters from the terminal to address, until a "return" or the count of characters have been received. One or more nulls are added at the end of the text.
FENCE	---	U	FENCE --- addr A user variable containing an address below which FORGETting is trapped. To forget below this point the user must alter the contents of FENCE.
FILL	addr quan b ---	U	FILL addr quan b --- Fill memory at the address with the specified quantity of bytes b.
FIRST	---	U	FIRST --- n A constant that leaves the address of the first (lowest) block buffer.

FLD	---	addr	U	IP	f ---	(run-time)
	A user variable for control of number output field width. Presently unused in fig-FORTH.				---	addr n (compile) P,C2,LO
FORGET	Deletes definition named cccc from the dictionary with all entries physically following it. In fig-FORTH, an error message will occur if the CURRENT and CONTEXT vocabularies are not currently the same.	E,LO			IF (tp) ... ENDIF	Occurs is a colon-definition in form:
	Executed in the form: FORGET cccc				IF (tp) ... ELSE (fp) ... ENDIF	At run-time, IF selects execution based on a boolean flag. If f is true (non-zero), execution continues ahead thru the true part. If f is false (zero), execution skips till just after ELSE to execute the false part. After either part, execution resumes after ENDIF. ELSE and its false part are optional; if missing, false execution skips to just after ENDIF.
FORTH	Set the primary vocabulary. The name of the primary vocabulary. Execution makes FORTH the CONTEXT vocabulary. Until additional user vocabularies are defined, new user definitions become a part of FORTH. FORTH is immediate, so it will execute during the creation of a colon-definition, to select this vocabulary at compile time.	P,L1				addr and n are used later for resolution of the offset and error testing.
	HERE	--- addrJump to the next available dictionary location.	LO			
	Leave the address of the next available dictionary location.					
HEX			LO			
	Set the numeric conversion base to sixteen (hexadecimal).					
HLD	addr ---> addr holds address of latest character of text during numeric output conversion.	LO				
	A user variable that holds the address of the latest character of text during numeric output conversion.					
HOLD	c ---	LO				
	Used between <# and #> to insert an ascii character into a pictured numeric output string. e.g. #12E #HOLD# will place a decimal point. Used in DO-LOOP to copy the index to the stack. Other use is implementation dependent. See R.					
	Used within a DO-LOOP to copy the loop index to the stack. Other use is implementation dependent. See R.	C,LO				
ID.	addr ---					
	Print a definition's name from its name field address. ID is also synonymous with # and is often used in combination with HOLD and COUNT.					
INDEX	from to ---					
	Print the first line of each screen over the range from, to. This is used to view the comment lines of an area of text on disc screens. INDEX does not align with WORD.					
INTERPRET	on stateful or stateless					
	The outer text interpreter which sequentially executes or compiles text from the input stream (terminal or disc) depending on STATE. If the word name cannot be found after a search of CONTEXT and then CURRENT it is converted to a number according to the current base. That also failing, an error message echoing the name with a "?" will be given. Text input will be taken according to the convention for WORD. If a decimal point is found as part of a number, a double number value will be left. The decimal point has no other purpose than to force this action. See NUMBER.					

KEY n --- (compiling) P,C2,L0	Leave the ascii value of the next terminal key struck.	LO LOOP	addr n --- (compiling) P,C2,L0 Occurs in a colon-definition in form: DO ... LOOP
LATEST n --- addr n --- (compiling) P,C2,L0	Leave the name field address of the topmost word in the CURRENT vocabulary. (applies to current) See LATEST	At run-time, LOOP selectively controls branching back to the corresponding DO based on the loop index and limit. The loop index is incremented by one and compared to the limit. The branch back to DO occurs until the index equals or exceeds the limit; at that time, the parameters are discarded and execution continues ahead.	At run-time, LOOP selectively controls branching back to the corresponding DO based on the loop index and limit. The loop index is incremented by one and compared to the limit. The branch back to DO occurs until the index equals or exceeds the limit; at that time, the parameters are discarded and execution continues ahead.
LEAVE n --- (compiling) P,C2,L0	Force termination of a DO-LOOP at the next opportunity by setting the loop limit equal to the current value of the index. The index itself remains unchanged, and execution proceeds normally until LOOP or +LOOP is encountered.	At compile-time, LOOP compiles (LOOP) and uses addr to calculate an offset to DO. 'n' is used for error testing.	At compile-time, LOOP compiles (LOOP) and uses addr to calculate an offset to DO. 'n' is used for error testing.
LINKS n --- (compiling) P,C2,L0	Converts a base register into its offset relative to the current memory cell.	M* n1 n2 --- d	A mixed magnitude math operation which leaves the double number signed product of two signed numbers.
LFA pfa --- lfa	Convert the parameter field address of a dictionary definition to its link field address.	M/ n1,n2 --- n3	A mixed magnitude math operator which leaves the signed remainder n2 and signed quotient n3, from a double number dividend and divisor n1. The remainder takes its sign from the dividend.
LIMIT n --- (compiling) P,C2,L0	Within a colon-definition, LIMIT is a constant leaving the address just below or above the highest memory available for a disc-buffer. (n) Usually this is equivalent to the highest system memory.	M/MOD n1 u1d u2 s --- u3 u4	An unsigned mixed magnitude math operation which leaves a double quotient u4 and remainder u3, from a double dividend u1d and single u3 divisor u2. (discusses u1d, u2, u3, u4)
LIST n --- (compiling) P,C2,L0	Display the ascii text of screen n on the selected output device. SCR contains the screen number during and after this process.	MAX n1 n2 --- max	Leave the greater of two numbers.
LIT n --- (compiling) P,C2,L0	Within a colon-definition, LIT is automatically compiled before each 16 bit literal number encountered in input text. Later execution of LIT causes the contents of the next dictionary address to be pushed onto the stack. If stack add fails at right word syntax add fails and no result because add was off frame.	MIN n1 n2 --- min	Leave the smaller of two numbers.
LITERAL n --- (compiling) P,C2,L0	If compiling, then compile the stack value n as a 16 bit literal. This definition is immediate so that it will execute during a colon definition. (n) The intended use is:	MINUS n1 --- n2	Leave the two's complement of a number.
LITERAL n --- (compiling) P,C2,L0	Compilation is suspended for the compile time calculation of a value. (discusses compilation is resumed and LITERAL compiles this value.) (n) If compilation is suspended, then the stack value n will remain there until the add operation executes. (n) If add fails, then the stack value n will be loaded again.	MOD n1 n2 --- mod	Leave the remainder of n1/n2, with the same sign as n1.
LOAD n --- (compiling) P,C2,L0	Begin interpretation of screen n. (discusses n) Loading will terminate at the end of (n) or the screen or at ;S. (See ;S and -->. (discusses n) If possible, execution of screen n will begin and take control of the stack. (discusses n) If not possible, then the stack will be restored to its previous state.	MON	Exit to the system monitor, leaving a re-entry to Forth, if possible.

		MOVE <i>addr1</i> <i>addr2</i> <i>n</i> --- Move the contents of <i>n</i> memory cells (16 bit contents) beginning at <i>addr1</i> into <i>n</i> cells beginning at <i>addr2</i> . The contents of <i>addr1</i> is moved first. This definition is appropriate on on word addressing computers.	PAD	--- <i>addr</i> --- Leave the address of the text output buffer, which is a fixed offset above HERE. This will facilitate reading the address of definitions added to the stack by commands such as NFA --- pfa. See also PFA.
NEXT		--- <i>addr</i> --- Leave the address of the text output buffer, which is a fixed offset above HERE. This is the inner interpreter that uses the interpretive pointer IP to execute compiled Forth definitions. It is not directly executable but is the return point for all code pro- cedures. It acts by fetching the address pointed by IP, storing this value in register W. It then jumps to the address pointed to by W. W points to the code field of a definition which contains the address of the code which executes for that definition. This usage of indirect threaded code is a major contributor to the power, portability, and extensibility of Forth. Locations of IP and W are computer specific.	PFA	Convert the name field address of a compiled definition to its para- meter field address. See NFA.
CM		----- This is a variable containing the address of the disc buffer most recently ref- erenced. The UPDATE command marks this buffer to be later written to disc. See also DISC.DELAY-DELAY & DISC.DELAY.	POP <i>addr</i>	The code sequence to remove a stack value and return to NEXT. POP is not directly executable, but is a Forth re-entry point after machine code.
DISC		----- This is a variable containing the address of the disc buffer most recently ref- erenced. The UPDATE command marks this buffer to be later written to disc. See also DISC.DELAY-DELAY & DISC.DELAY.	PREV <i>addr</i>	----- This is a variable containing the address of the previous stack value. See also PREV.
NUMBER <i>count</i> <i>addr</i> --- Convert a character string left at <i>addr</i> with a preceding count, to a signed double number, using the current numeric base. If a decimal point is encountered in the text, its position will be given in DPL, but no other effect occurs. If numeric conversion is not possible, an error message will be given.	PUSH	----- This code sequence pushes machine registers to the computation stack and returns to NEXT. It is not directly executable, but is a Forth re-entry point after machine code.		
OFFSET <i>addr</i> --- A user variable which may contain a block offset to disc drives. The contents of OFFSET is added to the stack number by BLOCK. Messages by MESSAGE are independent of OFFSET. See BLOCK, DRO, MDR1, MESSAGE.	PUT <i>addr</i>	----- This code sequence stores machine register contents over the topmost computation stack value and returns to NEXT. It is not directly exec- utable, but is a Forth re-entry point after machine code.		
OR <i>n1</i> <i>n2</i> -- Leave the bit-wise logical or of two 16 bit values.	QUIT	----- Clear the return stack, stop compil- ation, and return control to the operators terminal. No message is given.		
OUT <i>addr</i> --- A user variable that contains a value incremented by EMIT. The user may alter and examine OUT to control display formatting.	REVERSE <i>addr</i>	----- Copy the top of the return stack to the computation stack.		
OVER <i>n1</i> <i>n2</i> --- Copy the second stack value, placing it as the new top. This is useful when the current stack is full because it will not be possible to have room left to store the	RF <i>addr</i> --- A user variable which may contain the location of an editing cursor, window or other file related function.	----- Another copy of <i>addr</i> from the stack as <i>addr</i> for <i>PUT</i> .		

	SMUDGE	Used during word definition to toggle the "smudge bit" in a definitions' name field. This prevents an uncompleted definition from being found during dictionary searches, until compiling is completed without error.			
R/W	addr blk f --- d	The fig-FORTH standard disc read-write linkage. addr specifies the source or destination block buffer, blk is the sequential number of the referenced block; and f is a flag for f=0 write and f=1 read. R/W determines the location on mass storage, performs the read-write and performs any error checking.			
R>	--- n LO	Remove the top value from the return stack and leave it on the computation stack. See R>R and R.wdth spc.			
R0	--- addr U	A user variable containing the initial location of the return stack. Pronounced R-zero. See RP!.			
REPEAT	addr n --- (compiling) P,C2	Used within a colon-definition in the form: BEGIN ... WHILE ... REPEAT At run-time, REPEAT forces an unconditional branch back to just after the corresponding BEGIN. At compile-time, REPEAT compiles BRANCH and the offset from HERE to addr. n is used for error testing.			
ROT	n1,n2,n3 --- n2,n3,n1 LO	Rotate the top three values on the stack, bringing the third to the top. Values originally stored in n1, n2, n3 are now stored in n3, n1, n2. They do not necessarily remain whole numbers because direct and word operations can change them.			
RP!	---	A computer dependent procedure to initialize the return stack pointer from user variable R0.			
S->D	d --- d	Sign extend a single number to form a double number.			
SO	--- addr	A user variable that contains the initial value for the stack pointer. Pronounced S-zero. See SP!			
SCR	--- addr	A user variable containing the screen number most recently reference by LIST.			
SIGN	n d --- d LO	Stores an ascii "-" sign just before a converted numeric output string in the text output buffer when n is negative. n is discarded, but double number d is maintained. Must be used between <# and #>.			
	SP!	A computer dependent procedure to initialize the stack pointer from SO.			
	SP@	A computer dependent procedure to return the address of the stack position to the top of the stack, as it was before SP@ was executed. (e.g. 1 2 SP@ @ would type 2 2 1) At linking assembly code can be placed in the stack after the address to be used in self-validation.			
	SPACE	Transmit an ascii blank to the output device. A word consisting of a single carriage return and a line feed will be transmitted and will be considered valid if it is followed by a carriage return and a line feed.			
	SPACES	n --- LO	Transmit n ascii blanks to the output device.		
	STATE	variable birth certificate and password --- addr	addr --- addr	LO,U	A user variable containing the compilation state. A non-zero value indicates compilation. The value itself may be implementation dependent.
	SWAP	n1,n2 --- n2,n1 LO	Exchange the top two values on the stack.		
	TASK	---	A no-operation word which can mark the boundary between applications. By forgetting TASK and re-compiling, an application can be discarded in its entirety. See FORGET.		
	THEN	---	U THEN ---	P,C0,LO	An alias for ENDIF.
	TIB	---	addr	U	A user variable containing the address of the terminal input buffer.
	TOGGLE	addr b ---	addr	JUO	Complement the contents of addr by the bit pattern b.
	TRAVERSE	addr1 n --- addr2	addr	addr	Move across the name field of a fig-FORTH variable length name field. addr1 is the address of either the length byte or the last letter. If n=1, the motion is toward hi memory; if n=-1, the motion is toward low memory. The addr2 resulting is address of the other end of the name.

TRIAD *

scr ---

Display on the selected output device the three screens which include that numbered scr, beginning with a screen evenly divisible by three. Output is suitable for source text records, and includes a reference line at the bottom taken from line 15 of screen4.

TYPE

addr count ---

LO

Transmit count characters from addr to the selected output device.

U*

ul u2 --- ud

Leave the unsigned double number product of two unsigned numbers.

U/

ud ul --- u2 u3

Leave the unsigned remainder u2 and unsigned quotient u3 from the unsigned double dividend ud and unsigned divisor ul.

UNTIL

f --- (run-time)

Occurs within a colon-definition in the form:

BEGIN ... UNTIL

At run-time, UNTIL controls the conditional branch back to the corresponding BEGIN. If f is false, execution returns to just after BEGIN; if true, execution continues ahead.

At compile-time, UNTIL compiles (OBRANCH) and an offset from HERE to addr. n is used for error tests.

UPDATE *

Marks the most recently referenced block (pointed to by PREV) as altered. The block will subsequently be transferred automatically to disc should its buffer be required for storage of a different block.

USE *

--- addr

A variable containing the address of the block buffer to use next, as the least recently written.

USER

n ---
A defining word used in the form:

n USER cccc
which creates a user variable cccc. The parameter field of cccc contains n as a fixed offset relative to the user pointer register UP for this user variable. When cccc is later executed, it places the sum of its offset and the user area base address on the stack as the storage address of that particular variable.

VARIABLE

E,L,U

A defining word used in the form:

n VARIABLE cccc

When VARIABLE is executed, it creates the definition cccc with its parameter field initialized to n. When cccc is later executed, the address of its parameter field (containing n) is left on the stack, so that a fetch or store may access this location.

***** (REMOVED BY THE EDITOR)

VOC-LINK

U

--- addr

A user variable containing the address of a field in the definition of

the most recently created vocabulary.

All vocabulary names are linked by

these fields, to allow control for

FORGETting thru multiple vocabularys.

***** (REMOVED BY THE EDITOR)

VOCABULARY

E,L

A defining word used in the form:

ADD TO VOCABULARY cccc addr

to create a vocabulary definition

with a name cccc. Subsequent use of cccc will

make it the CONTEXT vocabulary which

is searched first by INTERPRET. The

sequence "cccc DEFINITIONS" will

also make cccc the CURRENT vocabulary

into which new definitions are

placed. ***** (REMOVED BY THE EDITOR)

LO

VLIST

List the names of the definitions in the context vocabulary. "Break" will terminate the listing.

LO

WARNING

U

--- addr

A user variable containing a value

controlling messages. If = 1

disc is present, and screen 4 of

drive 0 is the base location for

messages. If = 0, no disc is present

and messages will be presented by

number. If = -1, execute (ABORT) for

a user specified procedure.

See MESSAGE, ERROR.

LO

WHILE

P,C2

(run-time)

ad2 ad1 nl --- ad1 nl ad2 n2

Occurs in a colon-definition in the

form: ccc WHILE tp ... REPEAT

At run-time, WHILE selects condition-

al execution based on boolean flag f.

If f is true (non-zero), WHILE con-

tinues execution of the true part

thru to REPEAT, which then branches

back to BEGIN. If f is false (zero),

execution skips to just after REPEAT,

exiting the structure.

At compile time, WHILE emplaces (OBRANCH) and leaves ad2 of the re-
served offset. The stack values will
be resolved by REPEAT.

WIDTH --- *addr, #width*

In fig-FORTH, a user variable containing the maximum number of letters saved in the compilation of a definitions' name. It must be 1 thru 31, with a default value of 31. The name character count and its natural characters are saved, up to the value in WIDTH. The value may be changed at any time within the above limits.

See **BLK**, **IN**, **OUT**, **WORD**, **WORDC**, **WORDL**

WORD *charlist c* --- *width & text* LO
Read the next text characters from *charlist* until a delimiter *c* is found, storing the packed character string beginning at the dictionary buffer **HERE**. WORD leaves the character count in the first byte, the characters, and ends with two or more blanks. Leading occurrences of *c* are ignored. If BLK is zero, text is taken from the terminal input buffer, otherwise from *charlist* or the disc block stored in **BLK**.

See **BLK**, **IN**, **OUT**

WORDC *width charlist*

WORDL *width charlist*

X --- *any character*

This is pseudonym for the "null" or dictionary entry for a name of *height* and *one character* of ascii null. It is the execution procedure to terminate interpretation of a line of *height* and *text* from the terminal or within a disc buffer, as both buffers always have a null at the end.

(**ABORT** and **EVALUATE**)

XOR --- *n1 n2 --- xor* LI
Leave the bitwise logical exclusive-or of two values.

YIELD --- *any command*

[--- *any command*

] --- *any command*

P,L1 --- *any command*

Used in a colon-definition in form:

: xxx [words] more;

Suspend compilation. The words after

[are executed, not compiled. This

allows calculation of compilation

exceptions before resuming compil-

ation with]. See LITERAL,].

(**ABORT** and **EVALUATE**)

COMPILE --- *any command*

P,C --- *any command*

Used in a colon-definition in form:

: xxx [COMPILE] FORTH ;

[COMPILE] will force the compilation

of an immediate definition,

that would otherwise execute

during compilation. The above

example will select the FORTH

vocabulary when xxx executes, rather

than at compile time.

Only those entries listed in the

immediate section of the vocabulary

are available when this command is

executed. (**ABORT** and **EVALUATE**)

LI --- *any command*

Resume compilation, to the completion

backward of a colon-definition. See [,

] and P,L1. LI does not read

anything in the stack or define

anything in the dictionary.

ABORT --- *any command*

ABORT --- *any command*

EVALUATE --- *any command*

5.0 OVERLAYS

Overlays are little saved programs which have been compiled into a specific form that can be read and executed directly without having to recompile.

5.1 WHAT IS AN OVERLAY?

COPYRIGHT © 1980 JES

In COLORFORTH an overlay is a group of words which have been compiled into memory in a form which can be saved out to mass storage, in this case the cassette system.

COPYRIGHT © 1980 JES TRASHED

5.2 WHY DO I NEED OVERLAYS? To save time reading code in source bluode memory and also speed up the loading of a program over tape. As you become more familiar with COLORFORTH, as you will when writing longer programs. For code more than a few screens long, the time to read and load the screens becomes noticeably long. One can easily have programs with source code of dozens of screens, and these would take several minutes to read and load. What you gain by the use of overlays is the ability to save already compiled programs out on tape and the ability to load them back in without recompilation. Since a typical FORTH program is several times smaller in its compiled form, the compiled form occupies less tape which means it will take less time to read it in from the cassette. As an example, a 7k compiled overlay can be loaded in under two minutes while the source code for that would be over 40k bytes of text and would take over 14 minutes to read and load. QUITE A SAVINGS (of course you have to do it once!).

5.3 WHEN DO I MAKE AN OVERLAY?

It makes no sense to convert a program of 1 or 2 screens to overlay form. The time saved will not be significant, and for a 1 screen program no time will be saved because the compiled code is saved in units of 1k anyway. You should make overlays only after you have a program fully debugged! Once compiled, you won't have the source to change. ALSO, BE SMART AND BE SURE YOU SAVE THE SOURCE CODE TO CHANGE LATER IF YOU NEED TO!! If you don't know what I'm talking about you should read the next section on how to do so. If your program is over about 6 screens and it is working the way you want, then it is probably time to make an overlay.

5.4 HOW DO I MAKE AND SAVE AN OVERLAY? (LITERALLY, HOW DO I DO IT?)

Making an overlay is very easy. After you have written your program and have saved the source code on cassette in such a form that you can CLOADS it, you then type the following:

COPYRIGHT © 1980 JES

COLD <ENTER>

and the screen will return to the CLOADS bus, which has already taken This will empty memory.

Now, you may want your program to run with a different number of screen buffers than 8, so you may optionally select a different number of buffers by performing:

n #BLOCKS <ENTER>

where n is the number of buffers you wish (minimum is 1). Now you can start the overlay process by typing:

OVSTART n1 CLOADS <ENTRY>

where n1 is the number of screens of source on the cassette. If you have previously gotten all the bugs out, the program should load ok. When the loading stops (you get the OK), terminate the overlay by typing either just a blank screen code (NOTE: **CLOADS** requires just a blank screen code) or a command that has been put into **OVEND <ENTRY>**. To stop the program from running over will cause the tape to be overwritten. You can remove the last buffer easily. Actually, you may add to the program by typing it in before you type the **OVEND**. The overlay is now complete in memory, and so it is ready to be saved onto a cassette (A DIFFERENT CASSETTE!). Prepare a new tape for recording, and with the **RECORD** switch on type **COLD** at the beginning of each file you want written except the **OVEND** at the end of each file you want to write. Then type **OVSAVE <ENTRY>** and terminate with a blank screen code. This will save the compiled code out on tape. If you wish you can save it several times just to be safe.

***** NOTE *****

As mentioned earlier, it is recommended to store more than one set of text or one set of compiled overlay code on a single cassette tape. While it may seem wasteful to put only one thing on a tape, it is EXTREMELY easy to mistakenly write over a portion of the tape that you did not wish to write on when you try to use a tape for more than one thing. For sure, you may use both sides of a tape, and you may place more than one copy of something on a tape as assurance that it is recorded properly at least once. YOU WILL make mistakes! So be liberal in your use of separate tapes in order to minimize the loss of code when you do make them.

5.5 HOW DO I LOAD AN OVERLAY BACK IN?

Place the tape with the overlay into the cassette machine, rewind it, and place it in the PLAYBACK mode. Then type out the command:

COLD OVLOAD <ENTER>

COLD clears out memory, and **OVLOAD** reads the cassette. **#BLOCKS** will be reset to the value it had when the recording was made.

5.6 OVERLAY FACILITY GLOSSARY:

OVSTART (--) Signals start of an overlay. It creates an array of numbers in the beginning of memory and sets up pointers to hold the parameters for the overlay. Some of the parameters held are: **BMAX DP LATEST** link to last name field in kernel size of overlay.

OVEND (--) Completes the overlay setup in memory by filling in the incomplete array elements at the beginning of the overlay area.

OVLINK (--) Not used by the user in a direct manner. It is used by the system word **OVLOAD** to relink the dictionary after a new overlay has been read in.

OVSAVE (--) Save to cassette tape as many BLOCKS as required to hold the overlay currently in memory between OVSTART and OVEND. The tape recorder must have been prepared to record. OVSAVE uses BLOCK #1 while saving, so its contents will be lost.

OVLOAD (--) Reads from cassette tape a full overlay and links it into memory. It sets #BLOCKS to the value it held when the overlay was created. It is suggested that COLD be executed before any overlay is loaded. An overlay may be of any length which will fit into memory.

?OV (--) Checks the first definition in memory following LIMIT to verify that an overlay is indeed present. An error message is generated if not.

6.0 SOUND WAVES

For those of you interested in creating complex sounds with the COLOR COMPUTER, COLORFORTH has two words called TONE and WAVE. The COLOR COMPUTER has within it a Digital-to-Analog Converter (DAC) with 6 bit resolution (64 values). The output of the DAC is connected to the sound input to the television display, so any output from it may be heard there. To try an example, turn up the volume so you can hear the clicking of the keys very clearly. Now type:

```
DECIMAL 49152 12 4000 WAVE <ENTER>
```

The noise you hear is created by sending the first 4000 bytes of the COLORFORTH rom starting at memory location 49152 and holding each value with a duration value of 12 (which corresponds to a transfer rate of about 8 KHz).

The first number input to WAVE (49152 in this example) is the starting address of the table of values to send to the DAC, the second number is the duration of each hold value for the voltage (about 10 microseconds times the second number), and the last number is the number of bytes to send. The total duration of the sound is 10 microseconds times the product of the second and third numbers.

There is a table of values for a sine wave in the BASIC rom from address \$A85C to \$A87F. If this array is sent to WAVE, it will produce a single cycle of a sine wave. If one were to do that repeatedly, then a pure tone would be produced, and in fact TONE is a routine to do just that in an easier fashion. One could use that table as the basis of building up longer tables in memory. Some RADIO SHACK ROM games include VOICE! sent from a table in memory using this or a similar technique. It should be possible to receive voice through the JOYSTICK port by using a custom assembly language routine to build a voice array in memory, and then it may be sent back out by use of WAVE. HOW ABOUT ALL YOU INDUSTRIOUS EXPERIMENTORS OUT THERE!

6.1 SOUND SYSTEM GLOSSARY:

WAVE (a1\n2\n3 --) Custom wave form generation word.
Used with a user prepared table of values.
a1 is the start of a table of byte values, n2
is the time duration used, and n3 is the
number of bytes in the table.

TONE (n1\n2 --) Generates a tone (through the television speaker) of frequency n1 and duration n2. This word uses the BASIC ROM routines. The values of n1 and n2 are the same as would be used in BASIC. TONE uses the system interrupts for timing, so it cannot be used with the time word ?TIME.

7.0 GRAPHICS The word **GRAPHICS** will initialize all the matrices and, eventually add **COLRAG** routines used every day. It is a good idea to do this before doing any graphics program because it is easier to debug.

7.1 GRAPHICS CONTROL Do **GRAPHICS** first, then **COLRAG G303TX3** and add **COLRAG G303TX3** later if you have lots of memory and because

The COLOR COMPUTER has many interesting graphics modes. There are several words in COLORFORTH to allow you to control and select these modes. See the glossary section on the **GRAPHICS** words for a list and definition of their functions.

Most of the modes are part of existing bugs at the moment. The following is a list of the graphics modes available from the color computer and the values to go into the VCR and VDG registers to get them. For a detailed discussion, you should consult the manufacturer's specification sheet or see one of the articles published in various magazines on the details of the COLOR COMPUTER, e.g., the MARCH '81 BYTE magazine article. See **COLRAG MODE** and **COLRAG RESOLUTION** for values. Note that some of the modes listed below may not be implemented yet.

Internal Alphanumeric	0	0	64 x 32
Semographics	6	2	0x0000 9D164 x 48 WORD
Full Graphics 1 color	10	1	64 x 64
16k x 16k 1 B/W	12	1	128 x 64
32k x 16k 2 color	14	1	128 x 64
32k x 32k 2 B/W	16	1	128 x 96
64k x 16k 3 color	18	4	128 x 96 three bands
32k x 16k 3 B/W	1A	5	128 x 192
64k x 32k 6 color	1C	6	128 x 192
6 B/W	1E	6	256 x 192

Other modes are possible, but the above are the basic ones. The ones implemented in COLORFORTH are the Full Graphics 2, 3, and 6 color modes. (The numbers 1, 2, 3, and 6 refer to the number of kilobytes of memory required for the display screen.)

To use the Full Graphics modes effectively, you will have to assign an array in memory to be the graphics screen and plot all of your graphics into that array. Here is a simple way to do that on 16k or larger machines:

```
DECIMAL 5 BLOCK 512 / 1+ 512 * GSCR ! <ENTER>
```

This sets GSCR to point to an area which is 3k in size located between buffers 5 and 8, and which is forced to start on a 512 byte page boundary. To determine the page value for use in PG!, do the following:

```
GSCR @ 512 / CONSTANT NEW-PAGE
Now you may select the Full graphics 3 color mode and move the display to the new display area by executing the word VIEW defined by:
VIEW G3C NEW-PAGE PG !;
```

This will display the chosen graphics page, and if allowed to

continue, the system will immediately issue the OK back on the normal text display area. If you have just COLOR BASIC, the graphics screen will remain being displayed; however, if you have the EXTENDED BASIC ROM, then output to the normal text page causes the display to switch back there. Consequently, in the latter case, you must prevent the OK while you wish to view the graphics; this is conveniently done by placing KEY in the instructions where you wish the display to be held. Then, when you have finished observing the graphics, you can press any key to continue (it is good practice to DROP the character to keep the stack clean). So, to hold the displayed graphics screen, type one RKEY word after the end of defining said base definition. Below follows how to do this in the following code:

```
VIEW KEY DROP VNORM;
```

Now, the graphics page will be displayed until you press any key. If you do not have the EXTENDED BASIC ROM, then you cause the display to switch back to the normal page with VNORM. A completely general form which will behave the same whether you have the EXTENDED BASIC ROM or not is

```
VIEW KEY X DROP VNORM;
```

This will not be useful until you set up code to actually place something into the graphics page. To do that you must select a color and use the word SET to plot individual points. Rather than send the color for every point plotted, we set the color into the FORTH variable COLOR and then we must send only the x and y coordinates to SET. E.g., to use the RED color you would say:

```
SET X 200 Y 100 COLOR #0000FF;
```

RED COLOR !

First you will want to clear the graphics screen. In the case of using the G3C mode which uses 3k of memory (HEX 0C00 bytes), this would be done with this word CLR:

```
HEX : CLR GSCR @ 0C00 ERASE;
```

Erasing the screen is equivalent to setting it to green.

As an example, lets now define a word which will draw a diagonal line and then look at it. Define this word DIAG

```
HEX : DIAG CLR VIEW 40 0
      DO I I SET
      LOOP KEY DROP VNORM;
```

Now type the word DIAG and you should see a line drawn from the upper left (coordinate 0 0) to the lower right (coordinate hex 40 40). The display will stay until you press any key. The only function of the word KEY in the DIAG definition is to hold the display until you want to continue (and then the value of the key is DROPPed). As soon as DIAG is finished, the system will send you OK and to do that it returns you to the normal screen.

The COLORFORTH word SET will support only the color 2, 3, or 6 modes. The only thing which changes is the vertical resolution and the amount of memory required. To create another mode command, you may use the GMODE command as follows (e.g., to create G6B for 6k black and white):

HEX 1E 06 GMODE G6B <ENTER>

This command gives the highest possible resolution mode, but you will have to write your own version of SET to place the data in.

To add such a word, edit Y100.LIN source and for the advanced programmer who wants to play with such techniques, the source code for the SET command is in screen 20 of the source code. It is in HEX code which was hand assembled into a CODE definition. If it were written in full FORTH ASSEMBLY language (an ASSEMBLER to do this will be available on cassette) it would be:

```
HEX CODE SET
  D PULU, 0000# LDA, 0000 MUL, 2 STD,
  D PULU, COLOR LDA, LSRB,
 CCLR IF, 0000 LSRB, LSRA, ENDIF, LSRB, LSRA,
 CCLR IF, 0000 LSRA, LSRA, LSRA, LSRA,
 ENDIF, 0000 4 STA, CLRA, 2 ADDD, GSCR ADDD, D X TRF,
 X LDA, 4 ORA, X STA, NEXT C;
```

For the advanced programmer who wants to play with such techniques, the source code for the SET command is in screen 20 of the source code. It is in HEX code which was hand assembled into a CODE definition. If it were written in full FORTH ASSEMBLY language (an ASSEMBLER to do this will be available on cassette) it would be:

HEX CODE SET
 D PULU, 0000# LDA, 0000 MUL, 2 STD,

D PULU, COLOR LDA, LSRB,

CCLR IF, 0000 LSRB, LSRA, ENDIF, LSRB, LSRA,

CCLR IF, 0000 LSRA, LSRA, LSRA, LSRA,

ENDIF, 0000 4 STA, CLRA, 2 ADDD, GSCR ADDD, D X TRF,

X LDA, 4 ORA, X STA, NEXT C;

Copyright 1981, T. J. Zimmer and R. J. Talbot, Jr.

7.2 GRAPHICS SYSTEM GLOSSARY:

- PG! (n1 --) Sets the 512 byte page number n1 into the system 6883 chip as the current video display page. CAUTION: The text output (e.g., via EMIT or TYPE) still goes to the same memory page as before. PG! is used to perform graphics.
- VDG! (n1 --) Sets the graphics mode in the 6883 chip to the value n1. Only the lower three bits of n1 are used. See the chip's specification sheet or March 81 BYTE paper for programming information about this mode.
- VCR! (n1 --) Sets the graphics mode of the 6847 VDG chip to the value n1. Only the lower 5 bits of n1 are used for this function. See the March 81 Byte article on the color computer for information on this mode selection.
- VNORM (--) This restores the video display to the normal video mode. It is equivalent to
2 PG! O VDG! O VCR!
- COLOR (-- a1) A system variable used by SET; contains the code for the COLOR to be plotted.
- GREEN
- YELLOW
- BLUE
- RED (-- n1) Constants which place on the stack the value n1 which is to be stored into color. E.g.,
RED COLOR!
will set the COLOR to be RED.
- GSCR (-- a1) A graphics system variable which holds the address of the first byte in the GRAPHICS SCREEN. This variable must be set before the SET command is executed. See the section on GRAPHICS CONTROL for further discussion.
- GMODE (n1\|n2 --) A Defining word which is used to create these graphics mode control words:
G2C G3C G6C
Users would normally not use GMODE unless they are advanced graphics programmers making use of the modes not otherwise supported by COLORFORTH .
- G2C (--) Sets the GRAPHICS 2K BYTE COLOR mode. Sets the VDG and VCR to give a display of 128 x 64.
- G3C (--) Sets GRAPHICS mode to 128 x 96.
- G6C (--) Sets GRAPHICS mode to 128 x 192.

SET ($x\backslash y --$) Set a point in the GRAPHICS SCREEN which begins at the location in GSCR. MUST!! have previously set GSCR in order for this word to work. The color of the point set is the color held in the variable COLOR, which must have been set also. The SET word supports HIGHLIGHT for the three previously specified graphics modes. If you define a new mode by using a file named GMODE, the action of SET is undefined! Note: If you want to highlight a point, just use HIGHLIGHT after SET.

Hand note: The point of SET will persist until you change mode or until you exit from the screen.

SCOTTISH SCANDAL SOURCE

30 30 Set Set point at 30,30

30 30 Set Set point at 30,30

Hand note: 30,30 Set to point in the screen where art is first displayed holds until you leave the screen. To edit the art in this mode HIGHLIGHT will be enabled until you exit art mode and the screen configuration holds. To move the point around, simply type the coordinates again. To change colors, type the color name. To change modes, type HIGHLIGHT.

SOURCE KEYBOARD

Hand note: The keyboard source is a simple key input device. It consists of a series of keys, each with a unique code assigned to it. These codes are used to control various functions of the system. The keyboard is connected to the computer via a serial port, allowing for bidirectional communication between the two.

8.0 DEBUGGING AIDS

There are several useful aids for debugging COLORFORTH. One of the most useful is the FORTH DECOMPILER.

8.1 FORTH DECOMPILER

A very useful utility included in COLORFORTH is a decompiler. It allows you to take apart running FORTH code, including COLORFORTH itself! Of course, you have a listing of the source code for the whole system, but you will find the decompiler useful, especially when you forget the definition of some word.

Before explaining what the decompiler does, try it on your computer. Type in

```
SOURCE ERASE <ENTER>
```

You should see the computer type out

```
: ERASE 0 FILL ;S
```

That is the source code definition of ERASE. It fills a section of code with zeros. You will observe one thing which comprises one of the inner secrets of how FORTH operates -- the ; at the end of a colon definition inserts the code for ;S into the dictionary.

Try

```
SOURCE HEX <ENTER>
```

You will get

```
: HEX LIT 0 16 BASE ! ;S
```

In this case the definition has two bytes (0 and 16) which it does not recognize as a legitimate FORTH word, so it prints them out individually. Together they make up the 2 byte literal constant 16. The definition for HEX is

```
: HEX 16 BASE ! ;
```

The FORTH compiler recognizes that 16 is not a FORTH word, and it inserts the word LIT together with the number 16 into the dictionary.

At this point you might wonder why 0 appeared in the SOURCE of ERASE; why wasn't it LIT 0 0 ? The answer is that 0 is a FORTH WORD !

The decompiler looks up each part of the word being decompiled and tries to locate that part in the dictionary. When it finds it, the name is printed using .NAME . You can control whether or not the addresses themselves are printed by using

AON to turn on address printing

or AOFF to turn off address printing.

Try AON SOURCE HEX <ENTRY>.

The word SOURCE will trace only high level FORTH words, the ones made with : definitions. If you trace a CODE word like + you will just get a list of numbers --- it is a very slow way to get a memory dump! Just hold down any key to stop it.

The word ASOURCE is used by SOURCE. To use ASOURCE, you give it a parameter field address to start at. E.g. `ASOURCE 1000`

HEX CB16 ASOURCE <ENTER>

will also give you a trace of HEX, because CB16 is the parameter field address of HEX.

The sequence SOURCE XXX is exactly equivalent to

xxx ASOURCE

8.2 DEBUGGING SYSTEM GLOSSARY:

- DUMP (a1\n2 --) Dumps the contents of memory from a1 for a count of n2 characters using the current memory system and address base. Prints addresses to left, then 8 bytes per line.
- .NAME (a1\ a2 -- a3) If a2 is the Code Field Address of some word, the name of the word is printed, and a3 = a1. Otherwise, it prints the high byte of a2 and sets a3 = a1-1.
- .S (--) Nondestructive print of contents of stack.
- AON (--) Turns on the printing of addresses by SOURCE.
- AOFF (--) Turns off the printing of addresses by SOURCE.
- SOURCE (-- t;) Decompiles the first word in the text string t .
- ASOURCE (a1 --) Decompiles the FORTH word whose PFA is a1.
- AFLG (-- a1) A system variable used to specify whether or not the address of a word will be printed during the decompiling action of SOURCE.

9.0 GLOSSARY OF OTHER WORDS IN COLORFORTH BUT NOT IN fig-FORTH

9-1 CASSETTE WORDS:

READ (n1 --) Reads the first block encountered on cassette starting at the present position of the tape. It is read into memory buffer number n1. BLOCKs numbers are not stored on cassette with the block data, so they can be read into any available screen buffer. E.g.

3 READ <ENTER>

This will read the first block encountered on the cassette into screen buffer number 3. The data is now available to FORTH by using

READS ($n_1 \backslash n_2 \dots$) Similar to READ, but reads n_2 blocks into memory buffers $n_1 \dots n_1 + n_2 - 1$. E.g.

2.3 READS <ENTER> FOR EXIT

WRITE (n1 --) Block n1 is written out to cassette at the indicated tape position > where the tape is set. You must have the required correctly position of the tape and set the recorder to the record mode before executing this block. Use the command **!E.g.ink of "begin"!>** to write a given set of programs onto the tape and execute them. **!Enter#2 [WRITE <ENTER>] then#4#b**

WRITES(n1\&n2-->) Writes blocks number n1...n1+n2-1 to the ROM or RAM of the cassette. See READS .

CLOADS(n1---) Reads *n1* blocks from cassette sequentially,
each going into block buffer #1, and after
each is read. 1 LOAD is performed.

MOTOR (--) Similar to MOTOR in BASIC, but it simply toggles the motor to the opposite state each time it is executed; i.e., explicit ON or OFF is not stated.

9.2 LOADING WORDS:

THRU (n1\n2 --) BLOCKS n1 through n2 are LOADED in sequence.

TRY (--) The BLOCK specified in the variable SCR is LOADED. Since SCR is set when a screen is edited, after editing a screen one may just say **TRY** to load the new screen. An alternative approach is to type **QUIT** followed by **TRY** which will cause the system to test it.

MEMORY MANAGEMENT WORDS:**9.3 MEMORY MANAGEMENT WORDS:**

#BLOCK (n1--) Sets the number of BLOCK BUFFERS to n1 and sets DP to the end of the new buffer limit. It will not permit you to specify the number of buffers to be greater than the maximum allowed by the available memory:

size of memory	4k	16k	32k
number of buffers	1	14	29

EMPTY (--) Cleans out all words in the dictionary and resets the DP variable to LIMIT.

BMAX (-- a1) Places on the stack the address a1 which contains the maximum valid BLOCK number which the system will allow. Its value may be changed to inform the system that it should reallocate the available memory to give a different number of BLOCK buffers.

FREE(a1, -- n1) Returns n1, the number of free bytes of memory remaining. Computed by subtracting HERE from the contents of location \$74 (which is set by the BASIC.ROM upon reset). You can change the contents of location \$74 yourself also.

9.4 STACK MANIPULATION WORDS:

SO (-- a1) Returns a1, the address of a system variable which contains the address of the top of the data stack.

2OVER (d1\d2 -- d1\d2\d1) The second double number d1 is duplicated on top of the double number d2.

2SWAP (d1\d2 -- d2\d1) The two top double numbers are

and will be reversed in order. a word would be: Nav(f) (reverse) (Nav(f) is the word) equivalent to: `ROT`

2DROP(d1 --) The top double number (two single numbers) from the stack are dropped from the stack.

2DUP word (d1 --)(d1\|d1) The top double number is duplicated so now there are two of that a second copy is on the stack also.

2* (n1 -- n2) The top number is doubled (does a left shift by one bit). Written in assembly.

2/ (n1 -- n2) The top number n1 is halved (does a right shift by one bit). Written in assembly.

'S (-- a1) Leaves the current address of the top of the stack (on the stack) (thus increasing depth of stack base, push stack by one). Pseudonym for SP0.

Event van KREFTNER said at an assembly file that he
believed all I/O in Color Forth will be buffered and
the addrs of buffers were dynamically set by the CPU.

9.5 DISPLAY CONTROL WORDS:

? (a1 --) Prints the contents of the address a1 to the current output device using current base.

CUR (-- a1) A system variable which returns the address of location in memory which holds the cursor pointer. b) The sequence `! CUR ! dup !` (-- a1) (DASER) will leave the address of the current cursor position in the display on the stack.

CLS (n1--) n1 is passed to the BASIC ROM routine which does a screen clear. n1 specifies the color the screen is to be set.

U. (n1 --) Prints number n1 as a 16 bit unsigned number.

H. (n1 --) Prints number n1 as a 16 bit unsigned hexadecimal number; useful for addresses in memory. n1 is passed to the BASIC ROM routine which does a screen clear. n1 specifies the color the screen is to be set.

SCREEN (-- a1) Returns a1, the address of the upper left corner of the normal display screen (\$400).

CHAN word(--a1) Leaves as a1 the address \$6F which contains the channel variable used by the BASIC rom output routines. If Setting it to -2 will cause all output to go to the serial printer port; a value of 0 is normal crt output.

Serial to serial port below \$6F needed.

No influence on serial port if no connection to serial port.

INTC8

LISTS (n1\n2 --) Lists the screen n1 through n1+n2-1 to the current output device (controlled by CHAN). Each screen listed is followed by a FORM command which is recognized by most printers.

FORM (--) Emit a formfeed character (hex \$0C) to the output device. Moves printer to start of next page.

PRINT (. -- t;) Any output caused by the command line t will go to the serial port for the printer.

EXAMPLE: :1 23 PRINT FORM . <ENTER>

This will add the printing of screen #1 to the serial printer, send a formfeed character, and then print the number 23 .

After all commands up to the <ENTER> key have been executed, the serial port will be turned off and the output restored to the crt. Before PRINT may be used, the baud rate must be set by one of the BRxxx words.

BR110

Set the serial port baud rate to 110 bps.

BR300

Set the serial port baud rate to 300 bps.

BR600 Set the serial port baud rate to 600 bps.

BR1200 Set the serial port baud rate to 1200 bps.

BR2400 (--) Set the serial port baud rate as specified.

PAGE (--) Equivalent to the sequence 1 CLS . It just clears the screen to all green and homes the cursor to the upper left corner.

?CR (--) Tests the system variable OUT for a value

greater than or equal to 25; if it is, then it does a CR. Otherwise nothing is done.

When this word is run, it will return a value of 1 if a CR was done, and 0 if no carriage return was done.

9.6 JOYSTICK WORDS: All of the following words are for the joystick.

JSTK (--) Reads all of the joystick values and updates their respective memory locations. Joystick values may be retrieved from their locations by using the words JO, J1, J2, J3.

JO,J1,J2,J3 (--) Returns the values of the respective joystick variables. Must first execute JSTK to read them all. E.G. JSTK, JO, J1, J2, J3

Leaves the values of JO and J1 on the stack. Later, J3 would leave the value of that joystick reading as of the last execution of JSTK.

9.7 TIMER WORDS:

TIME and TIMEOUT are also described here.

TIME (-- a1) Leaves as a1 the address of a memory location which is decremented by the system clock. The location is decremented each 1/60th of a second, a "tick". Would be: `TIME`

TIMEOUT (n0 -- a1) Sets the contents of TIME to \$FFFF so that after n0 ticks a subsequent execution of ?TIME will be able to get the elapsed time in number of ticks. This word does not subtract from the current value of TIME.

?TIME (-- n1) Leaves as n1 the number of "ticks" since the last TIME was executed. It does this by subtracting the current value of TIME from \$FFFF. EXAMPLE:

: TEST TIMEO 3000 0 DO LOOP ?TIME . ;
followed by `TEST`

another will print the number of "ticks" of 1/60th of a second to execute the DO LOOP 3000 times.

NOTE: The timer uses the system's 60 hz periodic interrupt, the same ones used by the keyboard input routines. Consequently, do not do a timing operation on any which involves keyboard input.

TICKS (n1 --) System delay routine. n1 specifies a number of 1/60th second "ticks" to wait for. TICKS must be preceded by TIMEO to set the TIMER. The word TICKS will pause until n1 "ticks" have elapsed since the last execution of TIMEO.

EXAMPLES: Suppose that the words T5 and T40

take respectively 5 and 40 "ticks" to execute. Then if you type (-- 5n/40/1a) EXECUTE

and 5 ticks later type TIMEO T5 60 TICKS and it

will return having been idle for 5 ticks.

TIMEO T40 60 TICKS

and wait will each take 60 "ticks" to execute. In fact, the example with T5, 60 TICKS will take 65 "ticks"; in the case with T40, 60 TICKS will take only the remaining 20 "ticks".

If you were to type (-- 40/60/1a)

TIMEO T40 T40 60 TICKS

A not only then TICKS would return immediately.

TICKS is useful to synchronize parts of programs so that they take equal amounts of time.

9.8 ASSEMBLER WORDS:

CODE (-- t;) Starts a CODE definition. Creates a dictionary header with the name t . It then SMUDGES it, saves the current stack pointer in CSP, and then selects the ASSEMBLER vocabulary.

C; (--) Terminates a CODE definition, verifies that the current stack pointer is equal to the value saved in CSP by CODE, unSMUDGEs the header, and restores the vocabulary to that prior to when the CODE definition was started.

NEXT (--) An ASSEMBLER macro which appends the code for the NEXT operation to the end of a CODE definition. E.g.,

```
CODE XXXX x y z . . . NEXT C;
```

will define the word XXXX to perform the assembler code x y z . . . followed by the code for NEXT which returns the execution to the FORTH system, and then C; completes the definition by restoring pointers and checking for stack errors.

9.9 MISCELLANEOUS: (n1 --) and (a1\ a2\ n3 --)

MESS (n1 --) A new definition of the FORTH MESSAGE word. This word prints a brief text explanation instead of just an error number.

SMOVE (a1\ a2\ n3 --) Does the same function as CMOVE except that it translates the data so that it is displayed properly.

ASCII (-- t; n) Accepts the following string t , takes the first character and leaves its ASCII numerical value on the stack. When compiling, the numerical value is compiled as an inline literal E.g., if you type in

```
ASCII A @H.
```

will print 41, the hex numerical value for A.

9.10 FORTH-79 WORDS:

RECORDED BY R. J. TALBOT, JR.

The following FORTH-79 words have been added to the COLORFORTH system so that it is more compatible with the version of FORTH described by the book STARTING FORTH. Their definitions may be found in that book or in the definition of the FORTH-79 standard which is available from the FORTH INTEREST GROUP. Note: The FORTH-79 STANDARD is the efforts of that group to eliminate the previous differences between various implementations of FORTH. The COLORFORTH system has extensions which make it very close to FORTH-79; however, you should consult the section which discusses the differences if you wish to run FORTH-79 standard programs. For the expert, the FORTH INTEREST GROUP publishes a document describing how to convert fig-FORTH into FORTH-79. The following words in COLORFORTH do most of that conversion already. -- RJT

WHEN	?DUP	ROT1	NEGATE	>IN	REFINE	EXIT	NOT	-- CB-56 , BG
CONVERT	DNEGATE	DEPTH	D-	1-				and later
DO=	DK	UK	20	2!				

DEFER, ER, RD=DFA0,000 O> 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

High level forth is a subset of FORTH-79, and is defined by the following words.

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMAX -- CB-56 , BG

DEFER, ER, RD=DFA0,000 I' 2CONSTANT 2VARIABLE DMIN -- CB-56 , BG

I' FORWD RD = DEFER RD, except that DEFER RD is used to define .CB. variables

Any words which have different definitions in fig-FORTH than in FORTH-79 have been installed as fig-FORTH. All of the above words are in high level forth, except I' and J.

10.0 FORTH-79 DIFFERENCES

This is a fig-FORTH implementation of the language. However, to ease the transition to FORTH-79, many FORTH-79 words have been added where they do not conflict with fig-FORTH. The differences between COLORFORTH and the STARTING FORTH book will be covered here, on a chapter by chapter basis.

STARTING FORTH has several **EXTREMELY USEFUL** comments. COLORFORTH does not have them, so you may have to add them yourself. pg. 10 -- **LOAD** -- The screens in COLORFORTH are numbered 1 to 8. Chapters 1 & 2 -- **No differences noted.** pg. 11 -- **EDITOR** -- pg. 12 -- **INPUT** -- pg. 13 -- **OUTPUT** -- pg. 14 -- **DEPTH** -- pg. 15 -- **TOP** -- pg. 16 -- **ROT** -- pg. 17 -- **SWAP** -- pg. 18 -- **OVER** -- pg. 19 -- **OVERLAP** -- pg. 20 -- **OVERROT** -- pg. 21 -- **ROTATE** -- pg. 22 -- **ROTATEOVER** -- pg. 23 -- **ROTATEOVERROT** -- pg. 24 -- **ROTATEOVERROTATE** -- pg. 25 -- **ROTATEOVERROTATEOVER** -- pg. 26 -- **ROTATEOVERROTATEOVERROT** -- pg. 27 -- **ROTATEOVERROTATEOVERROTATE** -- pg. 28 -- **ROTATEOVERROTATEOVERROTATEOVER** -- pg. 29 -- **ROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 30 -- **ROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 31 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 32 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 33 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 34 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 35 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 36 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 37 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 38 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 39 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 40 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 41 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 42 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 43 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 44 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 45 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 46 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 47 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 48 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 49 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 50 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 51 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 52 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 53 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 54 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 55 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 56 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROT** -- pg. 57 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 58 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVER** -- pg. 59 -- **ROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATEOVERROTATE** -- pg. 60 -- **LOAD** -- The screens in COLORFORTH are numbered 1 to 8.

pg. 63-88 -- COLORFORTH contains this EDITOR plus many extensions.

pg. 68 -- LINE LENGTH -- The line length in COLORFORTH is 32 characters. So, some of the examples in the book will have lines which are too long. Just break them into two lines. COLORFORTH has 32 lines instead of 16 lines.

pg. 76 -- FLUSH -- The word FLUSH is not needed in this cassette version.

pg. 83 -- HANDY HINTS -- The word DEPTH and .S already exist in COLORFORTH.

Chapter 4

pg. 101 -- ABORT" -- COLORFORTH does not support ABORT". Just explicitly print out a message with ." and then use ABORT.

Chapter 5 No differences noted.

Chapter 6

pg. 140 -- U.R -- COLORFORTH does not have U.R . You can use .R usually, or if you need an unsigned right justified here is the definition:

```
: U.R 0 SWAP D.R ;
```

Chapter 7

pg. 161 -- /LOOP -- Not supported in COLORFORTH.

pg. 162 -- OCTAL -- Not used in COLORFORTH. For most computers, including 6809 systems, HEX is much more natural to use than OCTAL.

pg. 166 -- DOUBLE NUMBER DELIMITERS -- COLORFORTH recognizes only the decimal point as a double number delimiter.

pg. 173 -- DUK -- Not supported in COLORFORTH. This word is not supported in COLORFORTH.

pg. 174 -- M+ and M*/ -- Not supported in COLORFORTH.

Chapter 8

pg. 183 -- VARIABLE -- The definition of VARIABLE used in COLORFORTH is the one from fig-FORTH, which requires an initial value to be on stack before creating the variable. E.g.

12 VARIABLE DATE This word will create a variable with an initial value of 12. The definition of 2VARIABLE also requires an initial value on the stack, in this case a double number.

pg. 193 -- 2CONSTANT and 2VARIABLE -- Both are supported in COLORFORTH, but 2VARIABLE requires a double number on the stack for its initial value.

pg. 199 -- ERASE -- This is in COLORFORTH.

pg. 204 -- DUMP -- This is in COLORFORTH.

pg. 207 -- CREATE -- This word functions differently in fig-FORTH than in FORTH-79, and COLORFORTH uses the fig-FORTH definition. Use the following to create the definition of LIMITS as shown in the book:

220 VARIABLE LIMITS 340 ,170 ,100 , -190 , REDEFINING the STARTING FORTH book definition of CREATE based on the fig-FORTH definition. The rule of thumb is to use VARIABLE in place of CREATE for definitions which do NOT have DOES> in them. If the STARTING FORTH book definition is of the form with most of them did you write

... CREATE xxxx DOES> xxxx

then use **CREATE VARIABLE LIMITS 340 ,170 ,100 , -190 ,** REDEFINING the STARTING FORTH book definition of CREATE based on the fig-FORTH definition.

... <BUILDS xxxx DOES> xxxx

in COLORFORTH. This conforms to the normal fig-FORTH usage.

Chapter 9

pg. 216 -- FIND and EXECUTE -- COLORFORTH uses the fig-FORTH word -FIND in place of FIND. In fig-FORTH the word EXECUTE must receive the code field address instead of the parameter field address. Consequently, on this page of STARTING FORTH, one must change the example to:

* GREET CFA EXECUTE <ENTER> HELLO I SPEAK FORTH ok

Copyright 1981, T. J. Zimmer and R. J. Talbot, Jr.

pg. 217 -- VECTORED EXECUTION -- The techniques will work on COLORFORTH with the modification that the addresses obtained with ' are converted to code field addresses by use of CFA. E.g., pg.

line 6 would read ' HELLO CFA 'ALOHA !

pg. 217 -- SAY -- The definition of SAY in COLORFORTH is different from the example given in STARTING FORTH; see fig. 217. pg.

There are two changes here. The word ' (tick) is used, and because in fig-FORTH it is immediate, it must be compiled by the [COMPILE] word. The second change is the use of CFA to prepare the address for EXECUTE. pg.

pg. 219 -- NUMBER -- It is not vectored in COLORFORTH, so the example will not work. pg.

pg. 220 -- NAME LENGTHS -- Names in COLORFORTH may be up to 31 characters in length.

pg. 232 -- RELOAD -- No need, all code in rom!

pg. 237 -- H -- In COLORFORTH this word is called DP.

pg. 239 -- OPERATOR -- Not in COLORFORTH. pg.

pg. 240 -- OFFSET -- Not in this cassette system.

pg. 243 -- ASSEMBLER ORI -- COLORFORTH has a minimal ASSEMBLER vocabulary sufficient to hand assemble CODE definitions.

pg. 245 -- LOCATE -- COLORFORTH has the decompiler word SOURCE which may be used to see how a word is defined.

Chapter 10

xxxxx CEBOD KMKH STABRO

pg. 255-7 -- UPDATE, FLUSH, SAVE-BUFFERS, EMPTY-BUFFERS, BUFFER. These words not in cassette based COLORFORTH.

pg. 259 -- LABEL -- In COLORFORTH must change to : LABEL 8 * ? "LABEL" 3 + + 8 TYPE SPACE ;

COLORFORTH does not support ['] and the word ' serves the same function in a definition.

pg. 261 -- >TYPE -- COLORFORTH does not need >TYPE.

pg. 266 -- MOVE and <CMOVE -- Not in COLORFORTH, but in RTFORTH.

pg. 272 -- H -- Use DP BY . . . RETIRE EDITORX3 AND TEEBX3

pg. 281 -- Note: -TEXT in COLORFORTH is different from that defined in STARTING FORTH; see EDITOR definitions.

Chapter 11

pg. 291 -- VARIABLE CREATE -- To create the STARTING FORTH type of definition for VARIABLE, you can do this:

```
: VARIABLE <BUILDS 2 ALLOT DOES> ;
```

To create the COLORFORTH (i.e., fig-FORTH) type of definition for VARIABLE, you can do this:

```
: VARIABLE <BUILDS , DOES> ;
```

The COLORFORTH word CREATE is used only for creating CODE word headers.

pg. 292 -- DEFINING-WORD -- The definition of a DEFINING-WORD in the book must be changed to the following in COLORFORTH:

```
: DEFINING-WORD <BUILDS (compile-time action)
DOES> (run-time action) ;
```

The example for CONSTANT is then

```
: CONSTANT <BUILDS , DOES> @ ;
```

pg. 297 -- ARRAY -- The definition of ARRAY must be changed to

```
: ARRAY <BUILDS OVER , * ALLOT
DOES> DUP @ ROT * + + 2+ ;
```

pg. 313 -- DOES -- For most purposes COLORFORTH is the same as FORTH-79, but for the advanced programmer, see the document FORTH-79 STANDARD CONVERSION from the FORTH INTEREST GROUP.

pg. 332 -- JOB 1FIELD 2FIELD -- Again, these definitions must be changed to account for the different way CREATE works. Use

```
20 VARIABLE JOB 24 ,
00 VARIABLE 1FIELD 30 ,
30 VARIABLE 2FIELD 12 ,
```

pg. 339 -- SIMPLE FILES -- In screen 240 change the definitions of SURNAME, GIVEN, JOB, PHONE to the following:

```
00 VARIABLE SURNAME 16 ,
16 VARIABLE GIVEN 12 ,
28 VARIABLE JOB 24 ,
52 VARIABLE PHONE 12 ,
```

pg. 339 -- FREE -- Change the definition of FREE to the following:

```
: FREE 1 MAXRECS O
DO I OECORD ! RECORD C@ 33 <
IF NOT LEAVE THEN
LOOP
IF ." FILE FULL " ABORT THEN ;
```

pg. 339 -- ' (tick) -- Prefix all occurrences of ' with the word [COMPILE] , e.g.,
 AUTHOR DIRECTED WITH RESPECT OF THE FOLLOWING COLOR FORTH
 : CHANGE [COMPILE] ; PUT ;

pg. 347 -- screens 246 and 248 -- The definitions of DENSITY, THETA, and STRING will need to be prefixed with a ZERO (0) .

the additional to add addressable to the following will affect the value of the next few definitions.

1 <2300 . 011100> 01110000

WORD 3250 contains not only itself but also the following set of definitions:

1) BASE-DIGIT-FIND is to read in the digit -- READ-DIGIT-FIND -- see pg 347
 2) ENTHUSIASM at present is not based on these three bits

1) (nothing said--empty) 001100> 00110000
 2) (nothing said--empty) 001000>

and 3) THATWORD not defined yet

1 > 0 <2300 . 001100> 00110000

but hopefully not later when the read-in bits are taken up by other

1) TOLINE & READ-EDITLINE WORD

2) +C + + & TOLINE & READ-EDITLINE WORD

3) and 4) MICROBLDG macros from pg. -- <2300 --- bit 1-- see pg 347

5) and 6) MICROBLDG macros from pg. -- <2300 --- bit 2-- see pg 347

7) and 8) MICROBLDG macros from pg. -- <2300 --- bit 3-- see pg 347

9) and 10) MICROBLDG macros from pg. -- <2300 --- bit 4-- see pg 347

11) and 12) MICROBLDG macros from pg. -- <2300 --- bit 5-- see pg 347

13) and 14) MICROBLDG macros from pg. -- <2300 --- bit 6-- see pg 347

15) and 16) MICROBLDG macros from pg. -- <2300 --- bit 7-- see pg 347

17) and 18) MICROBLDG macros from pg. -- <2300 --- bit 8-- see pg 347

19) and 20) MICROBLDG macros from pg. -- <2300 --- bit 9-- see pg 347

21) and 22) MICROBLDG macros from pg. -- <2300 --- bit 10-- see pg 347

11.0 ERRORS, CRASHES, AND OTHER SUCH PROBLEMS

Errors and crashes happen all the time, and the source of a crash is often hard to find.

11.1 CRASHES

In the process of writing programs, we all make mistakes now and then. When this happens, there is a good chance that we will "crash" the program. If this happens, do not despair! Since COLORFORTH is in ROM, it does not get wiped out; it is simple to recover. Just turn it off, then turn it back on again.

DO NOT TURN OFF THE POWER, as this will cause your source code in the BLOCK buffers to be lost. Just press the RESET button on the right-rear. FORTH will reinitialize with the normal sign on message. FORTH does NOT clear out any buffer space on initialization, although it does reset BMAX to 8 (1 on a 4k system). So, if your program crash did not write over the buffer area, your program is preserved. You can go back to it to figure out the problem, reload, and retry it. First list out the source screens and look for bad code. If you find mistakes, fix them by editing. You may find that some "garbage" is in the screens, presumably because when your program went west, it wrote into the buffers. In this case, you can edit the errors, and go on. The last few lines of the buffer are cleared after each edit.

11.2 ERROR MESSAGES

When COLORFORTH detects an error, it will stop compiling and an appropriate error message is issued. The following is a list of the errors and their interpretation.

ERROR MESSAGE	MEANING
WHAT	FORTH could not find the word in the dictionary
STACK EMPTY	Some word tried to take something from the stack after it was empty.
MEM FULL	You have used up all available memory.
REDEF:	You have just redefined a word with a name which already exists in the dictionary. This is not a fatal error, just an informational message. Sometimes one deliberately redefines a name. Sometimes this reveals a mistake.
BLK RANGE	Attempted to access a BLOCK number outside the allowed range (normally 1 - 8).
?COMPILE	Tried to execute a word that may be used only within a definition.
?EXECUTE	Tried to compile a word into a definition which was meant for execution only.

?PAIRS A conditional structure such as IF ... ENDIF or DO ... LOOP was used without the correct matching terminating word.

NOT DONE Attempted to terminate a definition with a ; before you finished it.

SAVED VOC You attempted to FORGET a word in the saved vocabulary permanent romarea or below FENCE.

?LOADING Have attempted to execute a word that applies only to loading.

OFFSCREEN During an edit session the cursor position was found to point outside of the current screen.

SET VOCAB <1> <2> You tried to FORGET a word from a vocabulary defined by two other than the one you are currently in. You need to force the vocabulary pointers to the correct one by stating them in quotes after the <1> and <2>.

BAD OVERLAY <1> During use of the overlay word, <?OV> I looked at the program in memory and found it to not be an overlay.

DEFINITIONS <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

DEFINITION <1> <2> The definitions in <1> were not found in <2>.

OVERLAYS <1> <2> The overlays in <1> were not found in <2>.

12.0 SOME EXAMPLE CODE AND HANDY UTILITIES

This section contains some example code and utilities designed to supplement the ColorForth system. It includes utilities for moving the cursor around the screen, for inserting text, and for saving and loading files.

12.1 A JOYSTICK EDITOR

This addition to the EDITOR is given in source code form, in the listings on screens 23 and 24. You can type them in (they may go into any screen). This editor allows you to use the joystick to move the cursor around in the screen and then you can manipulate the text more easily. A very handy addition is the word GET which picks up the word under the cursor so that you can INSERT it later somewhere else.

The best procedure is to use the regular editor to place this into some screens, and then save it on cassette tape for later use. Then you can start it up by typing the command line with n1 EDIT J <ENTER>

where the number n1 is the screen number you wish to edit. You can now move the JOYSTICK around to move the cursor. CAUTION!! Many of the keys on the keyboard have an immediate function, i.e., you do not have to press <ENTER> after each key. Each of the old commands of the regular editor (e.g., P, X, etc.) has been assigned to a key -- see the source screen for J for the definitions). Pressing that key alone (no <ENTER>) will cause that word to be executed. For example, to insert some text at the position pointed to by the cursor, press I. The black cursor stops flashing and you are prompted with: > Enter a string of characters, then press <ENTER> again to continue editing at that position.

Try it! Insert a new word like IS and it appears on the next line. You should enter the string of text you wish to insert, followed by <ENTER>. When you press <ENTER> the text appears at the position of the cursor and control returns to the JOYSTICK.

Try it! E.g., insert this somewhere:

THIS IS A TEST

Now, suppose that you wish to move the second word of the above sentence to the next line. Position the cursor over the I or S in the word IS and then press the W button. The word disappears and the text on the line is compressed. The word IS is now in PADI, so we can insert it elsewhere. Move the cursor down one line, place it in the space just preceding the T in THIS on the previous line. Now press the I key, followed by <ENTER> (since the text to insert is already at PADI). The text will be placed in the new line!

Copyright 1981, T. J. Zimmer and R. J. Talbot, Jr.

This is only a small sample of what you can do. Try doing a sequence of things such as H followed by I . The N and B keys allow you to move to the next higher or lower screen for editing. You can do anything you want! You have the source!

12.2 PRINTING can be done by using the DLIST and LTHRU commands. A couple of useful utilities are given in screen 22 of the source listing. The words DLIST and LTHRU allow you to print portions of screens on a single page as was done in the documentation. DLIST was used as follows:

PRINT #1 or **DLIST <ENTER>**, will see all the entries you have typed in. This will list screens 1 and 2 to the serial port porta printer, side by side. The word LTHRU is similar to THRU, except it is used for printing as

PRINT 1-6 LTHRU <ENTER> prints each of the screens 1 through 6 in the DLIST format. Be sure to set the BAUD rate before using PRINT. It will repeat each line several times.

12.3 WORD LISTS **VLIST** (n) prints out words belonging to the program and lists them in the order in which they were entered.

HEX

The COLOR COMPUTER in one of the high resolution graphics modes can display one of two sets of four colors. To switch to the other set, one must change the fourth bit in the location hex \$FE22. A word to do this is

HEX : A1 T EE22 8 TOGGLE E :

13.0 COMMENTS ON THE SOURCE LISTING

This entire FORTH system was generated on a RADIO SHACK COLOR COMPUTER with 32k bytes of memory. While 32k may sound like a lot of memory, when you are developing a program which is 10k in length without benefit of disk, 32k is minimal. You will notice that the source is broken into two separate types of listings: the assembly listing and the high level FORTH source code. This is because it was possible to hold in the computer enough source for only 5k of machine code. The next step was to type in a minimal, very small editor from the keyboard. Once that was in, it was used to enter a full editor into screens and they were saved on cassette for later use.

Now with a useful editor, it was easier to work! The rest of the COLORFORTH system was gradually developed until a 10k system was complete. The final step was to patch the bootup dictionary links at C00E and C010 so that the full COLORFORTH would come up upon cold start. That was burned into proms.

We would like to apologize for the lack of comments in the listing. It was caused by a lack of space. There was just barely room to get the 5k of assembly code in, much less comments.

Some interesting notes about the high level source: There are several words in the listing which do not appear in a VLIST. This is because their names in the dictionary were overwritten with a space. The first of these is on screen 1, line 18. The word 'B' was created only to be used to create the words for doing Baud rate setting. After it was used to create BR110 -- BR2400, its function was no longer needed, so it was deleted in line 24. This technique was used several times throughout the source. We were not trying to hide anything from you (you have the source), but rather we were trying to keep the dictionary from getting cluttered with single character, meaningless names. We could have given them longer names, but that would just use up valuable space for things you would never use.

In screen 5, lines 19 to 22, the words 'J' and 'JJ' appear. We wanted to put in down arrows, but control characters are not always visible. So we compiled the words with letter names and then in lines 21 and 23 they were written over with down arrows (Just try that with a FORTRAN compiler! or a BASIC interpreter!).

It is interesting to note that 19 pages of FORTH creates about 5k of compiled code, while it took over 30 dense pages of assembly to create 5k of code. FORTH is much more efficient and much more easily readable.

We hope that you find this an enjoyable product. We enjoyed doing it, and it is our hope that you will find that FORTH is a useful powerful language for getting more out of your COLOR COMPUTER. If you write programs which run with COLORFORTH, consider marketing them. FORTH is an excellent language for writing games and doing graphics. The benchmarks we have done show that COLORFORTH is much faster than COLOR BASIC, so that you can do games and such in real time with high level code.

Other options planned will include a file editor, new file formats, and Future products being planned are DISK versions of COLORFORTH and a TINY PASCAL compiler running on COLORFORTH. What are you going to write? It's up to you!

The present source code could be adapted for use on other 6809 computers. However, much of it is specific to the COLOR COMPUTER, and other parts are done in a space-conserving fashion, so that we could get a maximum of utility into a given space of ROMs. If you have other 6809 systems, contact TALBOT MICROSYSTEMS for information on its line of tFORTH products for SS-50 bus and EXORCISER(tm Motorola) bus systems.

With all the hardware to hand, and not much work to do, it is time to start writing! Good luck, and good hunting!

Good luck everyone. Have fun and good luck to all who attempt to learn the art of programming. The world needs more people who can program well. It's not easy, but it's worth it. If you have any questions or comments, feel free to write to us at TALBOT MICROSYSTEMS, Inc., 1000 N. University Street, Seattle, Washington 98103. We're always looking for new ideas and ways to improve our products. Your suggestions are welcome, and we'll try our best to incorporate them into our products. We're always looking for new ideas and ways to improve our products. Your suggestions are welcome, and we'll try our best to incorporate them into our products.

If you have any questions or comments, feel free to write to us at TALBOT MICROSYSTEMS, Inc., 1000 N. University Street, Seattle, Washington 98103. We're always looking for new ideas and ways to improve our products. Your suggestions are welcome, and we'll try our best to incorporate them into our products.

Good luck everyone. Have fun and good luck to all who attempt to learn the art of programming. The world needs more people who can program well. It's not easy, but it's worth it. If you have any questions or comments, feel free to write to us at TALBOT MICROSYSTEMS, Inc., 1000 N. University Street, Seattle, Washington 98103. We're always looking for new ideas and ways to improve our products. Your suggestions are welcome, and we'll try our best to incorporate them into our products.
